

Supplementary Figure S4. Relative expression of *JUP* in peripheral blood and leukemia-derived cell lines. qPCR assays were used to determine mRNA levels tacking *RPLP0* and *RPS18* as reference genes. SC.PB.1 and SC.PB.2 are sample controls; the first was set as calibrator. The difference between all groups was calculated with a one-way ANOVA test. Asterisks indicate statistical significance ($p < 0.0001$). An average and standard deviation of the Fold change obtained with the *RPS18* and *RPLP0* reference genes are depicted.
