Supplementary Table S3. Showing the parameters of the feature selections used in this study

Feature Selection	Parameters
Recursive Feature Elimination (RFE)	Linear regression estimator, 10-fold cross-validation, number of features selected depends on the number of features set and ranked based on the performance metric (root mean squared error (RMSE)) based on cross-validation.

LASSO	10 fold cross validation, regularization parameter using minimum cross-validation error criterion
MRMR	Mutual information (MI) as relevance measure, conditional mutual information (CMI) as redundancy measure, and a weighted sum method to combine measures

Supplementary Table S4. Showing the parameters of the LASSO and Random Forest models

Model	Parameters	Evaluation metric
LASSO	Lambda = lambda min*, 5 and 10-fold CV	AUC
Random Forest	1000 trees, max node=20, mtry=1-20,5 and 10-fold CV	Accuracy

\*Lambda min was obtained by using the cv.glmnet() function in R to fit a LASSO regression model with elastic net regularization. 10-fold cross-validation to select the optimal value of the tuning parameter lambda, which controls the strength of the L1 regularization penalty. The lambda.min value which corresponds to the minimum cross-validated error, was then chosen as the optimal value of lambda.

Supplementary Table S5. Showing the indices of robust features selected by 3 different feature selection in each dataset with different ratio of perturbed endpoints

Supplementary Figure S1. Showing the diagram to generate random features

Supplementary Figure S2. showing the sensitivity of the radiomics model both in training dataset and testing dataset for dataset1 and dataset2

a Dataset 1

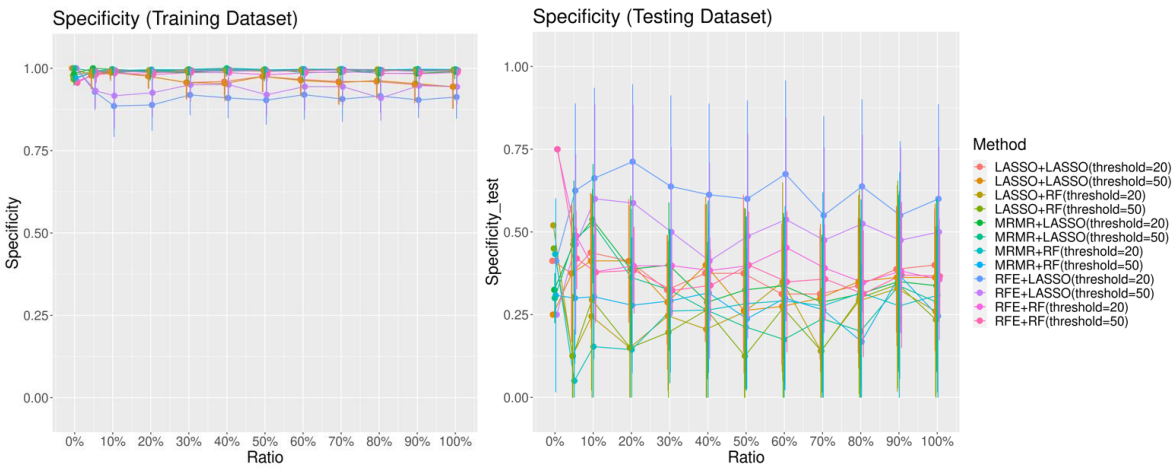

b Dataset 2

Supplementary Figure S3. Showing the specificity of the radiomics model both in training dataset and testing dataset for dataset1 and dataset2

a Dataset 1

b Dataset 2

Supplementary Figure S4. Shows the importance of the top 10 most important radiomics and random features towards the radiomics model along with the total mean contribution of random features using Random Forest and LASSO classifiers for dataset 1 (a,b respectively) and dataset 2 (c,d respectively) with the maximum threshold set to 50 for the feature selection methods across every repetition and different feature selection methods for the different ratio of additional random features.
