

Supplementary Figure S1.

Three mice were injected with three batches of MCF10A cells exposed to Folate^{RDI}/Diuron^{3MAC}/PFOA^{3MAC} (S1, S2 and S3). After 21 days, mice were euthanized and the tumors resected. The injection of MCF10A-UP cells is used here as a positive control for mammary tumorigenesis (Pacaud et al. 2014; Duforestel et al. 2019).
