The abscissa represents the retention time (min) of metabolite detection, and the ordinate represents the intensity (cps: count per second) of the ion current. Figure S2. Metabolites difference between leaves of H11 (green leaves) and H12 (red leaves). (a) Compared H12 with H11, most isoflavone and flavone metabolites were up-regulated based on relative quantitative contents. (b) The up-regulation of major flavanone, flavonol, anthocyanidin and proanthocyanidin metabolites. (c) The down-regulation of most amino acid derivatives and organic acids. The darker the color, the higher the metabolites expression level. Figure S3: Go classification of different expression genes in leaf transcriptomes of *E. ulmoides* among different samples. Figure S4: KEGG enrichment of down-regulated genes in H12 (red leaves) compared with H11 (green leaves) in *E. ulmoides*. Figure S5: Differential expression of the genes related to photosynthesis pathway. The expression level was based on FPKM value. The darker the color, the higher the gene expression level. Figure S6: Phylogeny of all EuMYBs and AtMYBs. Those MYBs involved in flavonoids biosynthesis were focused. Phylogenetic analysis followed the settings: the maximum likelihood method, the substitution model was Dayhoff, priors set to the Yule Model, the birth rate was 1.0, the mcmc chain length was 10,000,000, bootstrapping set to 1,000, and the TreeAnnotator program set the posterior probability limit to 1.0 with a burn in percentage of 90. The scale bar indicates the average number of amino acid substitutions per site. Figure S7: Phylogeny of all EubHLHs and AtbHLHs. Phylogenetic analysis followed the above settings.
