

a)

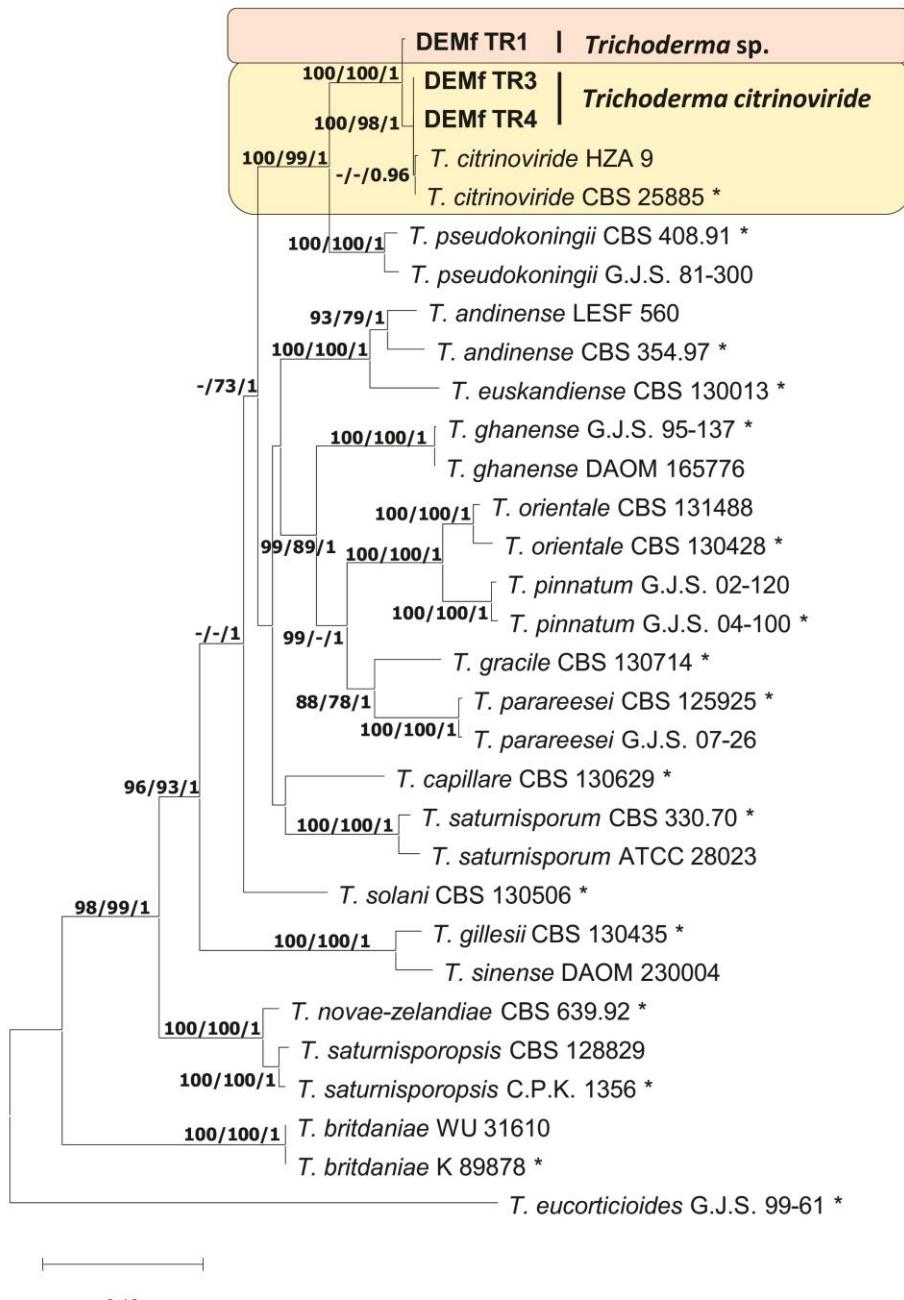

b)

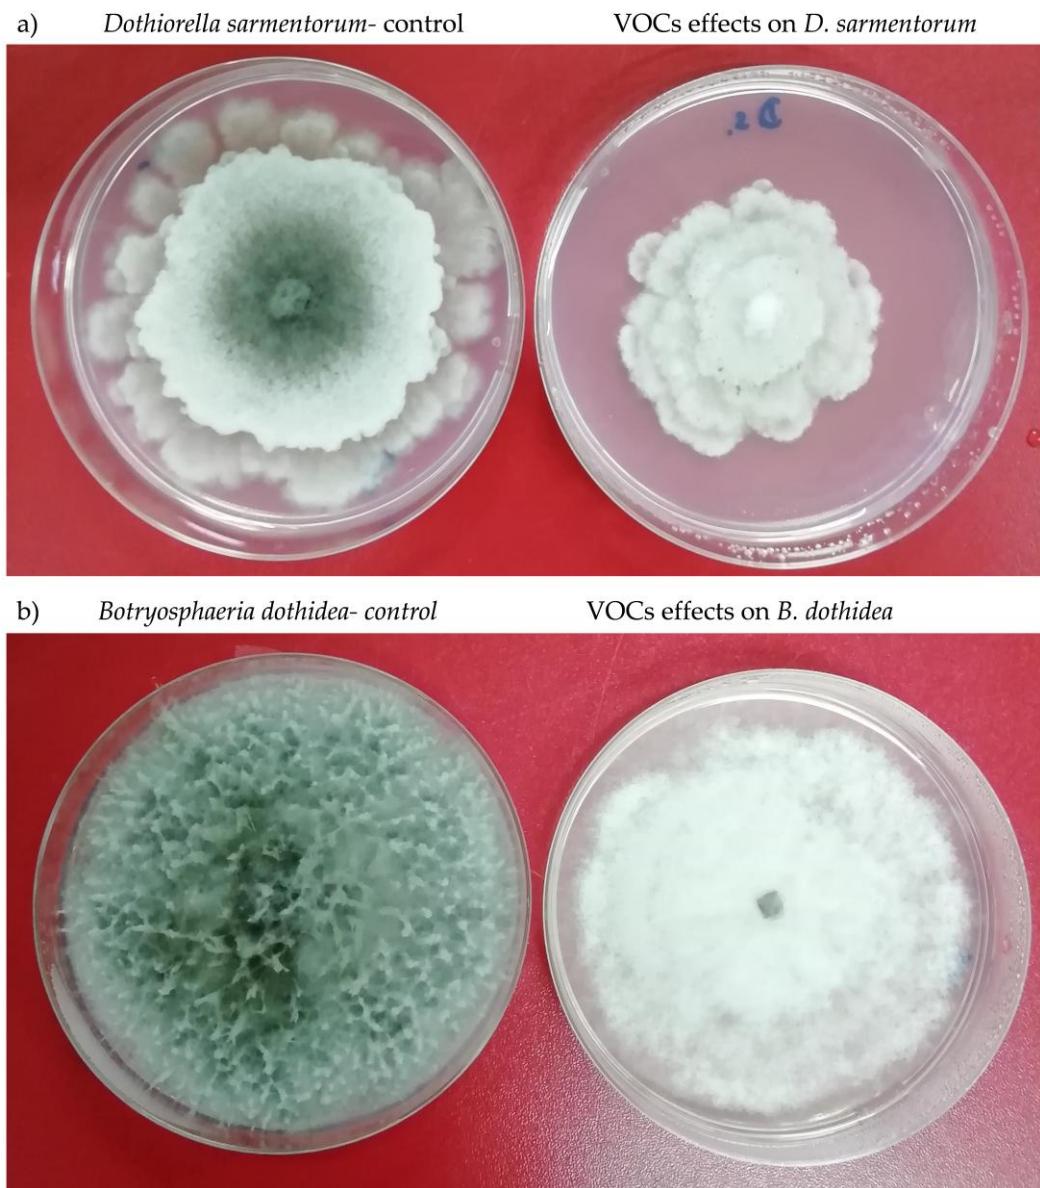

c)

**Figure S1.** Phylogenetic trees generated from Maximum likelihood (ML) analyses based on a single gene alignment of a) RPB2, b) TEF 1- $\alpha$ , and c) ITS sequence data. ML bootstrap support values greater than 70% are indicated at the tree nodes (ML). The type strains are marked with an asterisk. Isolates sequenced in this study are given in bold and highlighted. *Trichoderma eucorticoides* (G.J.S. 99-161) was included as an outgroup. Scale bar indicates expected number of substitutions per site.

**Figure S2.** Phylogenetic tree generated from a maximum likelihood analysis (ML) based on a concatenated alignment of tef 1- $\alpha$  and RPB2 sequence data showing the position of *Trichoderma citrinoviride* in relation to its closely related species belonging to the *Longibranchiatum* clade. ML and maximum parsimony (MP) bootstrap support values greater than 70% and Bayesian posterior probability values (PP) greater than 0.95 are indicated at the tree nodes (ML/MP/PP). The type strains are marked with an asterisk and isolates sequenced in this study are shown in bold. *T. eucorticoides* G.J.S. 99-61 (clade *Hypocreanum*) is included as an outgroup. Scale bar indicates expected number of substitutions per site.

**Figure S3.** Effects of VOCs of *Trichoderma citrinoviride* DEMf TR4 on mycelial growth of *D. sarmentorum* (a) and *B. dothidea* (b).

**Table S1.** Sequences used in the phylogenetic analyses.

<sup>1</sup> Ex-type or ex-epitype strains are shown in italic.

<sup>2</sup> Strains sequenced in this study are shown in bold.

<sup>3</sup> ITS: Internal Transcribed Spacer; tef 1- $\alpha$ : partial translation elongation factor 1-alpha gene; RPB2: RNA polymerase II gene.

<sup>4</sup> Dashes indicate that the corresponding sequence was not available from GenBank.
