800μg/mL	92±1	18±1[c]	117.50±7.95[c]	28.33±1.15[c]

Data were showed in mean ± SD, n = 3. Values with different letters in the same column indicate

statistical significance (*p*<0.05)

Table S2 Effects of SH on the fecundity of *C. elegans*(N=5)

Concentration (μg/mL)	Experimental group（N=5）					Mean ± SD
	1	2	3	4	5	
0	310	315	309	300	309	308±6[a]

*Data were showed in mean ± SD, n = 5. Note: Mean number of eggs laid is rounded and values with

different letters in each group indicate: a significant difference between the two groups (*p*<0.05)

Figure S1 Drug sensitivity test of SH against Escherichia coli OP50. The three plates shown are all NGM (d=90 mm); each plate was divided equally into three parts, 400 μl OP50 was taken and spread evenly on the plate, and the bacterial solution was allowed to dry before being pasted onto circular paper sheets (d=5 mm) containing SH solution. a. 200 μg/ml of SH solubility; b. 400 μg/ml of SH concentration; c. 800 μg/ml of SH concentration. In each group, all the paper sheets were surrounded by the appearance of inhibition circles.
