Table S4. ANOVA models for Temperature, pH, Humidity, and Brix responses. The models are significant as indicated by their respective F-values of 94.26, 41.34, 38.69, and 74.56. The probability of obtaining such large F-values due to noise is very low (0.01%). The p-values less than 0.0500 for model terms A, B, and AB indicate that they are significant in all four models. Values greater than 0.1000 suggest that model terms are not significant, and their removal may improve the model if there are many insignificant terms.

Table S5. The ANOVA for Wi, Fi, and Di responses. The models for Wi, Fi, and Di are significant. The F-values for Wi, Fi, and Di are 77.37, 31.60, and 9.59, respectively, indicating that the models are highly significant with only a 0.01% chance that the observed F-values are due to noise. The p-values for the model terms A, B, and AB are less than 0.0500 for Wi and Fi, and B is significant for Di, indicating that these terms have a significant effect on the response variable. Poisson Regression (Type III) for Fd. The significant model terms A, B, and AB, with p-values less than 0.0500. Values greater than 0.1000 indicate that the model terms are not significant. The analysis used χ^2 Log Likelihood Ratio p-values. Analysis was performed with a log link and inverse link of exp, using Maximum Likelihood (ML) analysis
