3D Structure prediction for each deduced actin-like protein fragments of the *Tv* genome database was obtained in the Swiss Model Server from EXPASY (<https://swissmodel.expasy.org/>) [Waterhouse, A., Bertoni, M., Bienert, S., Studer, G., Tauriello, G., Gumienny, R., Heer, F.T., de Beer, T.A.P., Rempfer, C., Bordoli, L., Lepore, R., and Schwede, T. 2018. SWISS-MODEL: homology modelling of protein structures and complexes. Nucleic Acids Res. 46, W296-W303; Xu J, and Zhang Y. 2010. How significant is a protein structure similarity with TM-score = 0.5? Bioinformatics. 26(7):889-95] using the deduced aa sequence. These data were one of the parameters to consider for the identification of possible bona fide actin proteins (Group I) and actin-like protein segments (Group II) in *Tv*. **GMQE**, Global Model Quality Estimate. It is a quality estimate, which combines properties from the target-template alignment and the template 3D structure. GMQE gives an overall 3D model quality measurement between 0 and 1, the higher numbers indicating higher expected quality (Waterhouse *et al.*, 2018).
