Table S1. Demographics and phenotypic features according to clinical groups (G1-G5) in the NF1 cohort. In column ID all NF1 patients were indicated with specific code (NF_ followed by an Arabic number) corresponding to the 'unique patient identifier' of the clinical centre. Age is referred to age at diagnosis. Group 1 (G1) includes patients with classical NF1 phenotype, including 6 or more café-au-lait spots (CALMs), axillary and inguinal freckling, two or more Lisch nodules and neurofibromas, without other manifestations of extra-cutaneous/ocular involvement; Group 2 (G2) encloses NF1 patients presenting the phenotypic features of G1 plus involvement of skeletal apparatus, central nervous system (epilepsy, intracranial vascular malformations, hamartomas/UBOs) and mental system (intellectual disability, anxiety/depression/sleep disorders), vascular system and anomalies of internal organs; Group 3 (G3) includes NF1 patients presenting the phenotypic features of G1 plus multi-apparatus involvement and histological diagnosis of MPNST; Group 4 (G4) includes NF1 patients presenting the phenotypic features of group G1 plus multi-apparatus involvement and neoplasms of the central and peripheral nervous systems; Group 5 (G5) includes NF1 patients presenting the clinical traits of G1 plus multi-apparatus involvement and neoplasms of variable grade of various organs and apparatus. UBOs: Unidentified bright objects; MGUS: Monoclonal Gammopathy of Undetermined Significance; MPNST: Malignant Peripheral Nerve Sheath Tumor, GIST: Gastrointestinal stromal tumor. F: female, M: male.

Table S2. Sequencing techniques performed and NGS details. Next-generation sequencing (NGS), Real Time PCR (RT-PCR), Sanger sequencing, and Multiple Ligation Probe Amplification (MLPA) were applied to *NF1* mutation analysis. NGS details including depth of the identified *NF1* variants, average depth, minimum and maximum depth are shown.
