

Supplementary

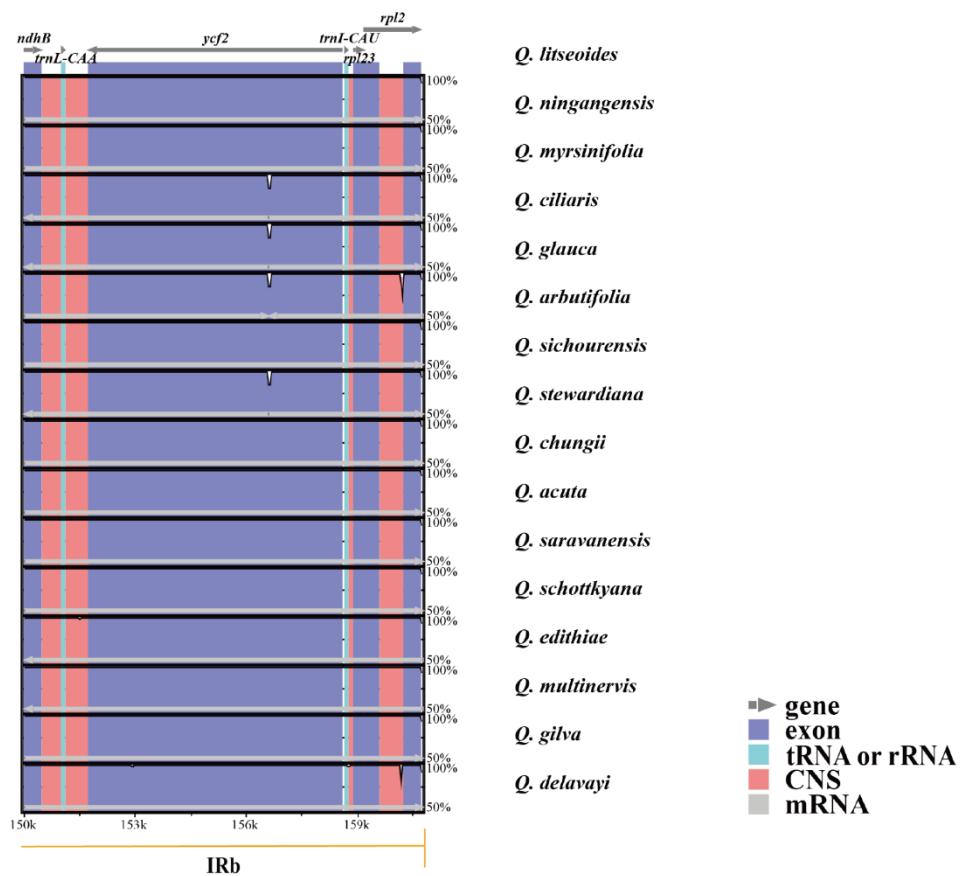

Figure S1. Visualization of the aligned sequence of the 16 chloroplast genomes of *Quercus* section *Cyclobalanopsis* with *Q. litseoides* as a reference using mVISTA. The gray arrows above show the locations of the reference sequence genes, and the direction is forward or reverse. The position of the genome is shown on the horizontal axis at the bottom of each block. The alignment similarity percentages are shown on the right side of the graph (vertical axis). Genome regions are color coded as protein-coding (exon), tRNA or rRNA, and conserved non-coding sequences (CNS).

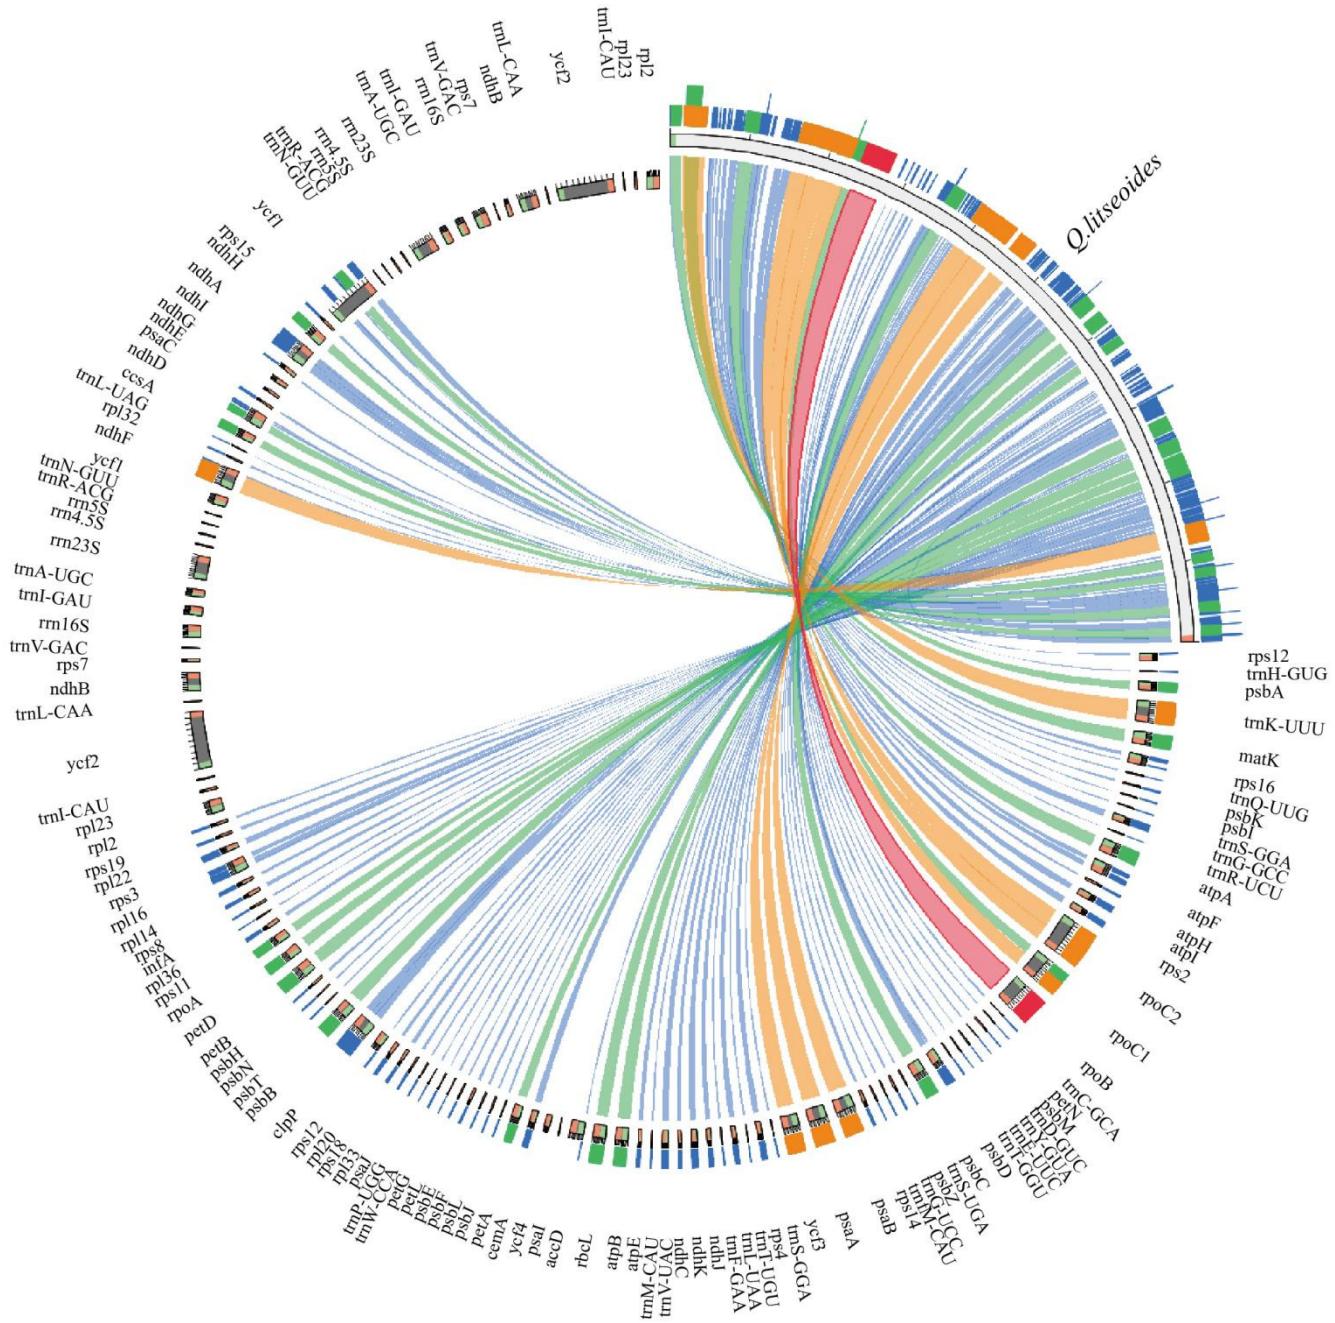

Figure S2. Visualization of homologous sequence alignment of chloroplast genomes. The final alignment sequence is on the right and the corresponding genes are on the left. The visualized map shows the reception and relative locations of these genes. Different colors in the figure represent the similarity between the final alignment sequence and the original sequence, that is, blue \leq 50%, green \leq 75%, orange \leq 99.999%, and red $>$ 99.999%.

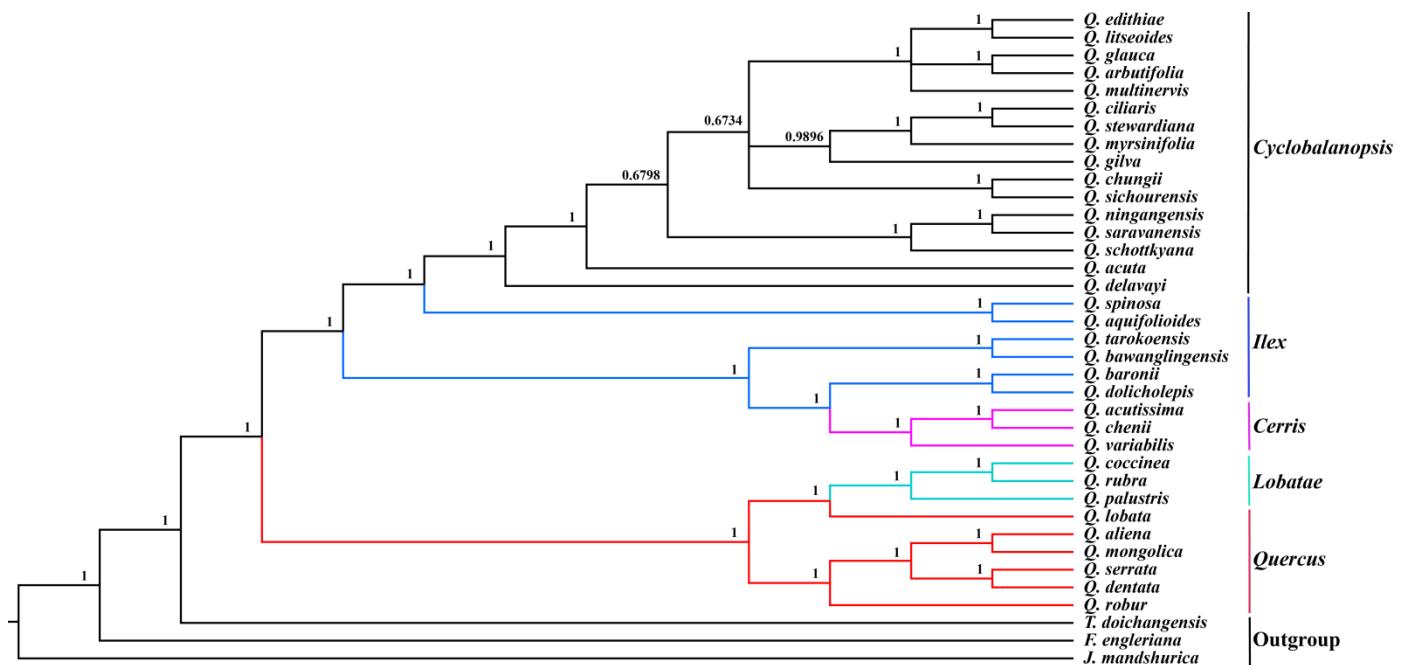

Figure S3. The phylogenetic tree among 37 chloroplast genome homologous sequences based on BI method. Values besides the branch represented Bayesian posterior probabilities (PP). Abbreviations: *Quercus* (*Q.*), *Trigonobalanus* (*T.*), *Fagus* (*F.*), and *Juglans* (*J.*).

Table S1. Information on the chloroplast genomes used in this study.
