

Supplementary Materials

CRISPR/Cas9-Mediated Mutation in *XSP10* and *S1SAMT* Genes Impart Genetic Tolerance to Fusarium Wilt Disease of Tomato (*Solanum lycopersicum* L.)

Supplementary Information

Supplementary Figures:

Supplementary Figure S1. Overview of sgRNA design, CRISPR cloning into expression vector, protoplast transformation and sequencing for editing events.

Supplementary Figure S2. Molecular confirmation of CRISPR transformants in tomato protoplasts.

Supplementary Figure S3. Molecular and histochemical confirmation of positive transformants of single and DDXS. A-D.

Supplementary Figure S4. Chromatograms confirming the CRISPR editing events of single and dual-gene in tomato leaves tolerant to *Fol 1332*.

Supplementary Figure S5. Pathogen leaf disc assay for single-gene CRISPR edited tomato leaves infected with *Fol 1322* strain.

Supplementary Figure S6. Positive plant transformants of CRISPR/Cas9 construct.

Supplementary Figure S7. Chromatograms confirming the CRISPR editing events of single and dual-gene of *S. lycopersicum* cv. Arka Vikas at GE₀ generation.

Supplementary Figure S8. Sanger sequencing and chromatograms confirming the CRISPR editing events of SX and SS of GE₀ generation from *S. lycopersicum* L.

Supplementary Figure S9. Presence of T-DNA integration in GE₁ progeny.

Supplementary Figure S10. Sanger sequencing and chromatograms confirming the CRISPR editing events of single (SX and SS) and dual-gene (DXS) of GE₁ generation from *S. lycopersicum* L.

Supplementary Figure S11. *Fol 1322* colonization in 10-12 days old seedlings of tomato cv. AV at 12 h and 24 h post-inoculation.

Supplementary Figure S12. Single and dual-gene CRELS of *XSP10* and *S1SAMT* showed reduced necrotic lesions upon *Fol 1322* infection in tomato leaves.

Supplementary Figure S13. Potential off-target sites generated in GE₀ CRELS by Sanger sequencing method.

Supplementary Tables:

Supplementary Table S1. Primers used in this study.

Supplementary Table S2. Summary of sgRNA design of target genes *XSP10* and *S1SAMT* along with off-target details.

Supplementary Table S3. Data measurement of lesion size upon *Fol 1322* infection in control and single-gene constructs using Image J software.

Supplementary Table S4. Data measurement of lesion size upon *Fol 1322* infection in control and dual-gene (DXS) constructs using Image J software.

Supplementary Table S5. Statistical data analysis of root colonization in 10–12 days old seedlings of tomato cultivar Arka Vikas using Image J software.

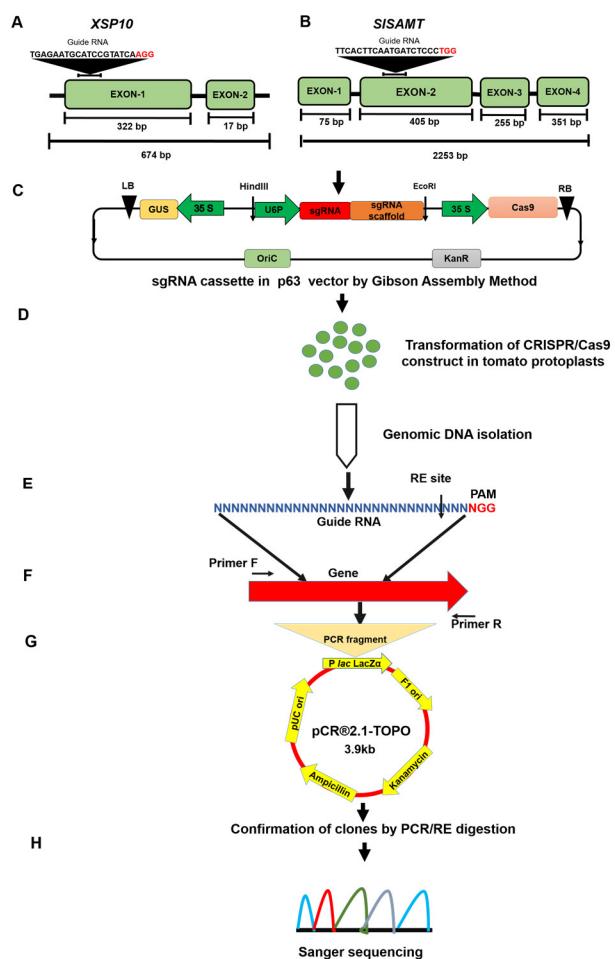

Supplementary Table S6. Data measurement of cell death/mm² in infected tomato leaves upon *Fol 1322* infection in WT, single (SX and SS) and dual-gene (DXS) constructs using Image J software.

Supplementary Table S7. Data measurement of H₂O₂ release/ mm² in infected tomato leaves upon *Fol 1322* infection in WT, single (SX and SS) and dual-gene (DXS) constructs using Image J software.

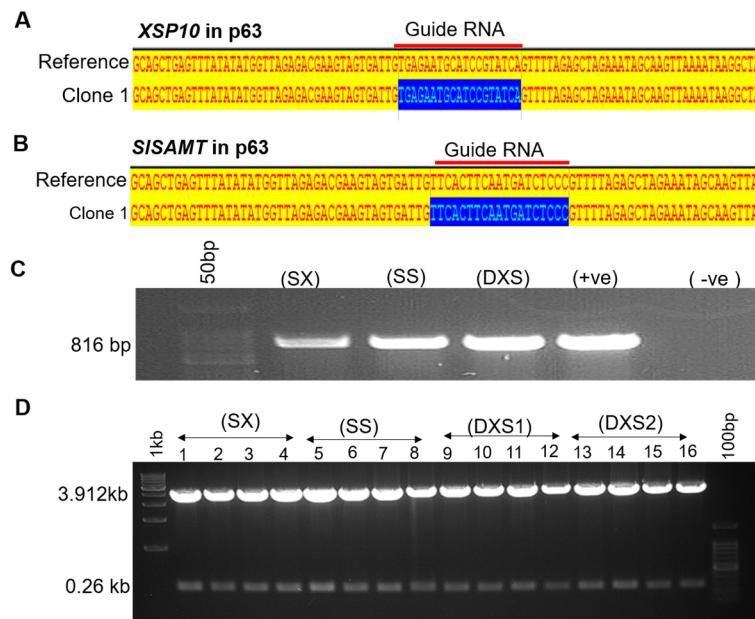

Supplementary Table S8. Data measurement of fresh weight (g) of Mock, WT, single and dual-gene (DXS), and Arka Abhed upon *Fol 1322* infected tomato plants.

Supplementary Table S9. Data measurement of disease severity of single and dual-gene (DXS) in 4 weeks old tomato infected plants.

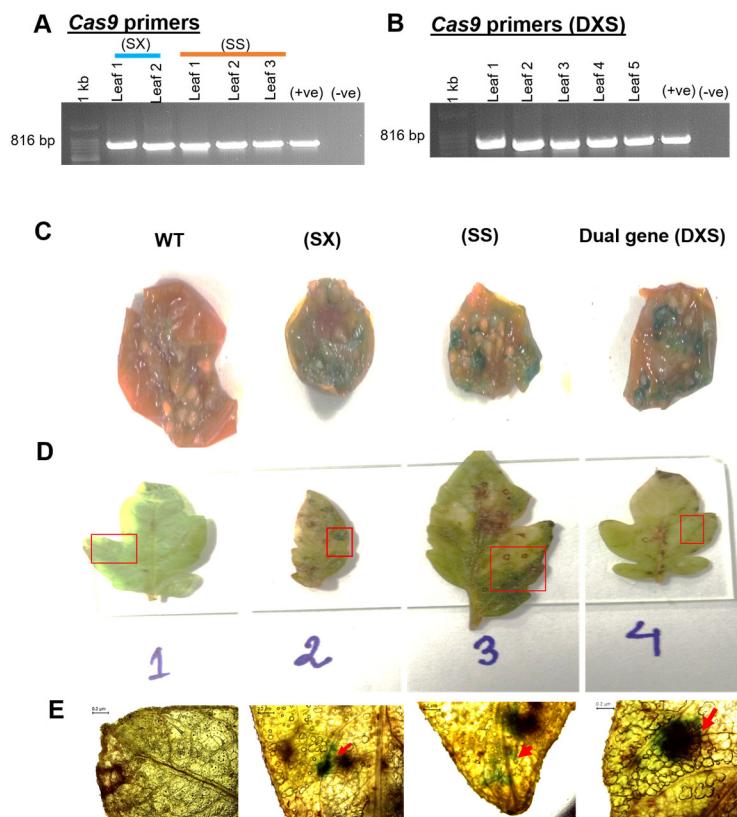

Supplementary Table S10. Data measurement of fungus colonization in WT and CRELS upon *Fol 1322* infection in tomato (*S. lycopersicum* L.).

Supplementary Figure S1. Overview of sgRNA design, CRISPR cloning into the p63 expression vector, protoplast transformation and sequencing for editing events. sgRNA designing of *XSP10* (A) and *SISAMT* (B). C. sgRNA cassettes assembled in p63 vector by Gibson assembly method. D. The single-gene and dual-gene CRISPR constructs transformed into tomato protoplast cells. E. PCR confirmation of expression of Cas9. F. PCR fragments ligated and cloned into pCR2.1 T/A cloning vector and confirmation by PCR and restriction digestion (G). H. Detection of CRISPR editing events through Sanger sequencing.

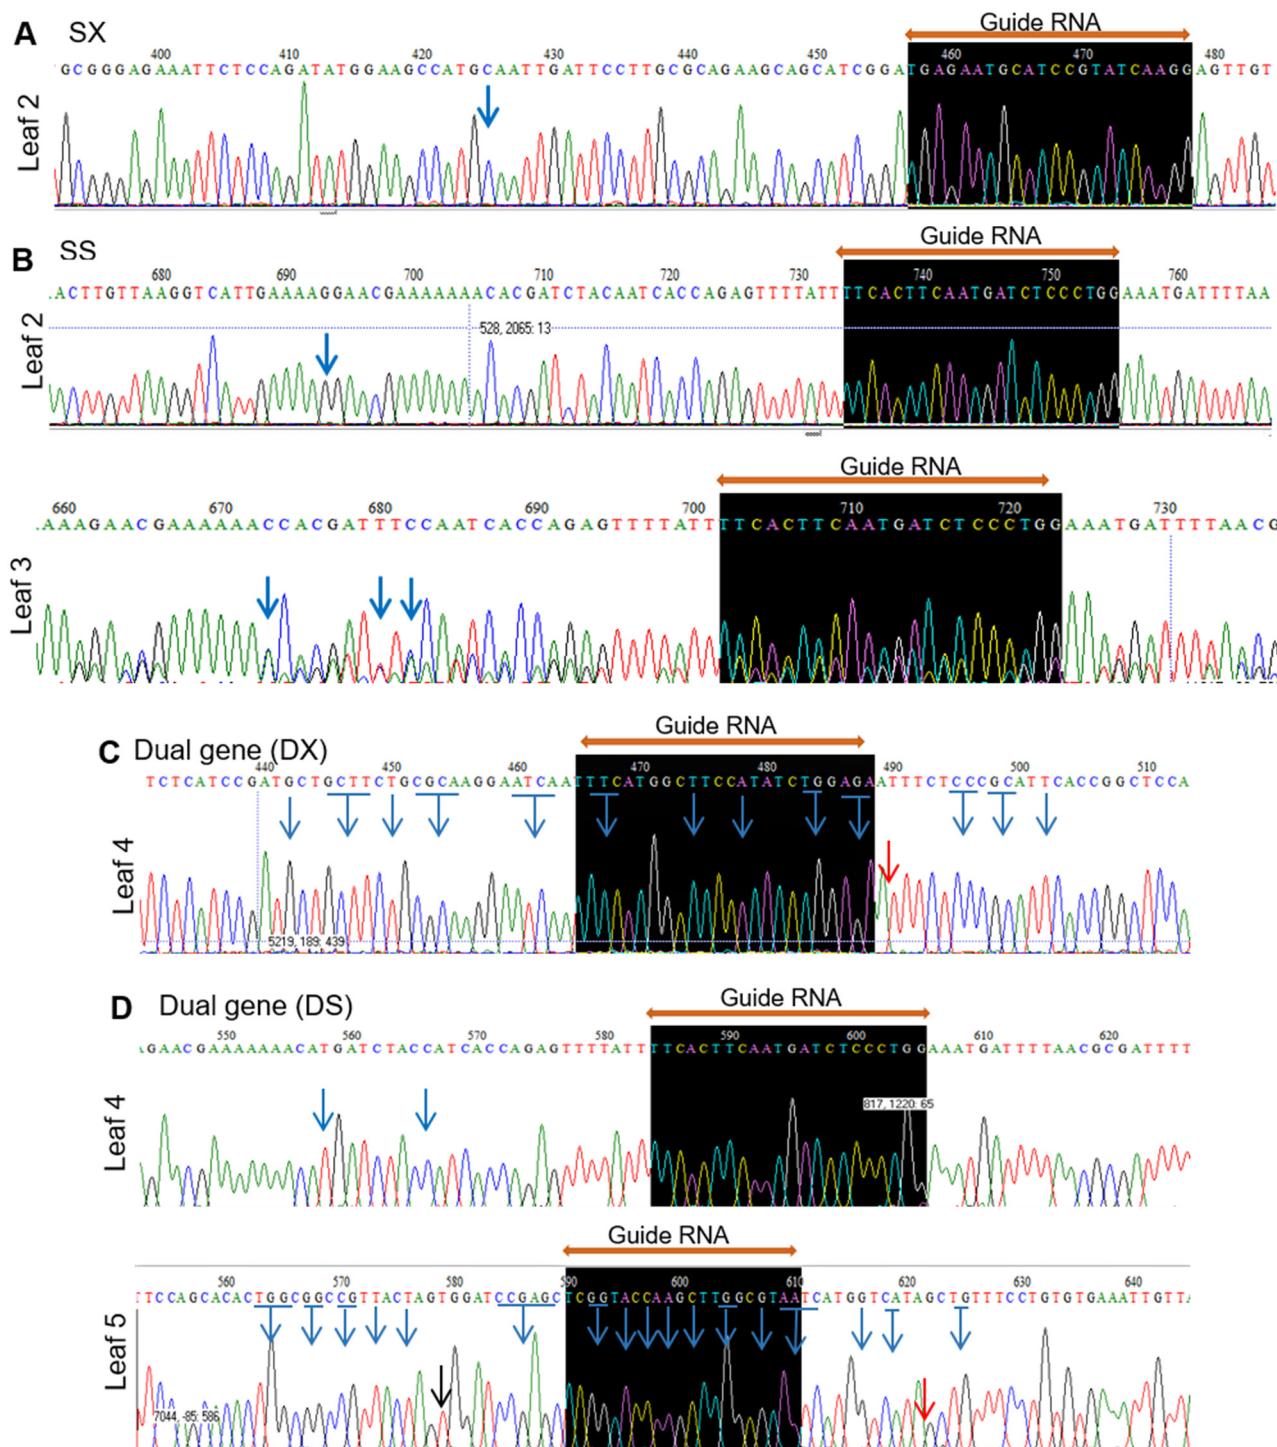

Supplementary Figure S2. Molecular confirmation of CRISPR transformants in tomato protoplasts.
Confirmation of sgRNA sequence of *XSP10* (**A**) and *SISAMT* (**B**) in p63 binary expression vector through Sanger sequencing. **C.** Detection of Cas9⁺ in transformed tomato protoplasts through PCR of single (SX and SS) and dual gene DXS (**D**) restriction digestion confirmation of positive clones of single and dual gene PCR product into sub-cloning vector pCR2.1 with enzyme EcoRI.

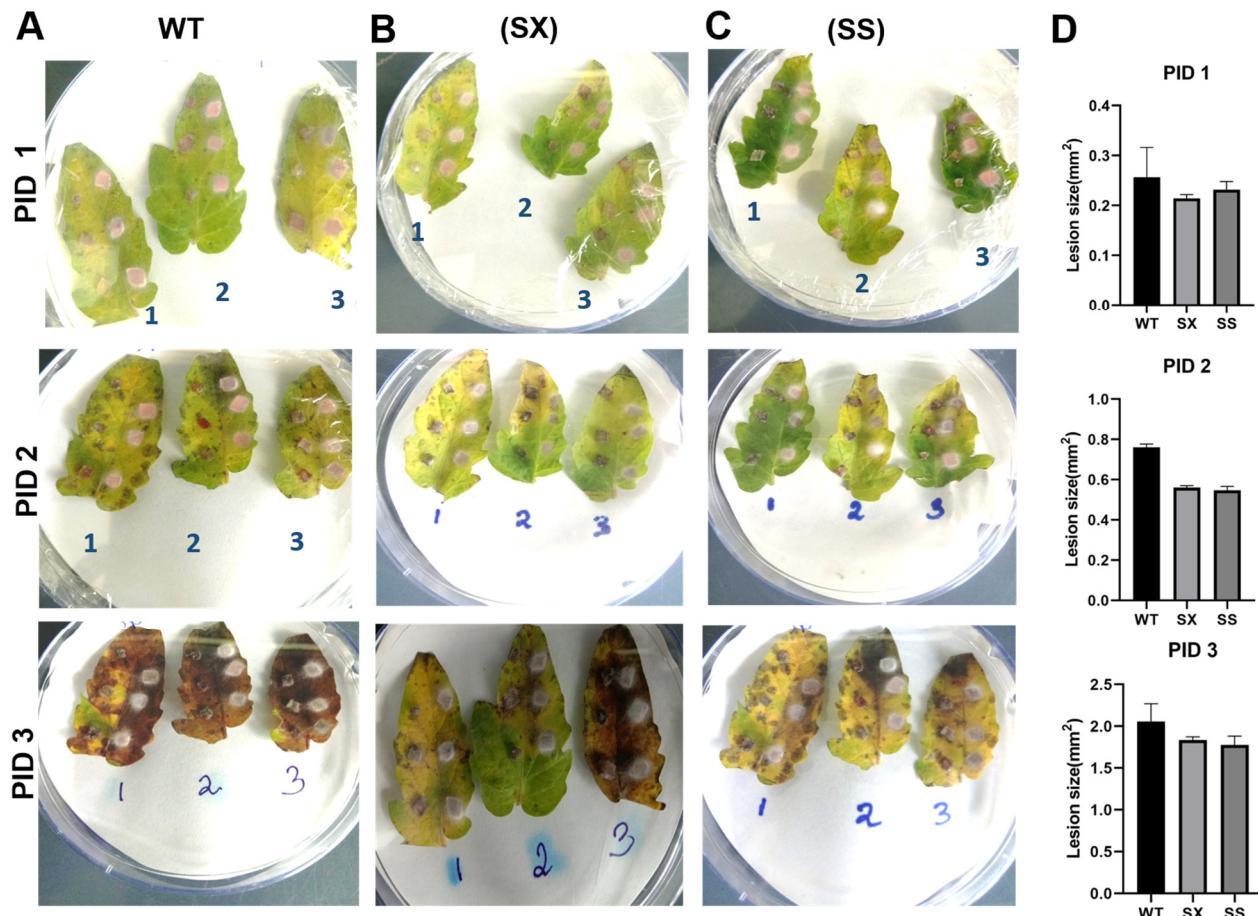

Supplementary Figure S3. Molecular and histochemical confirmation of positive transformants of single and DXS. **A-B.** PCR confirmation using Cas9. Histochemical GUS staining of single and dual-gene (DXS) CRISPR/Cas9 construct of *XSP10* and *SISAMT* in fruit tissues (**C**) and leaf tissues (**D**) of tomato cultivar AV.

E. Expanded light microscopy images of leaves showing GUS staining for better clarity. No GUS activity was observed in control (water treated) fruits and leaves. SX: Single-gene editing of *XSP10*, SS: Single-gene editing of *SISAMT*, DXS: Dual-gene editing of *XSP10* and *SISAMT*.

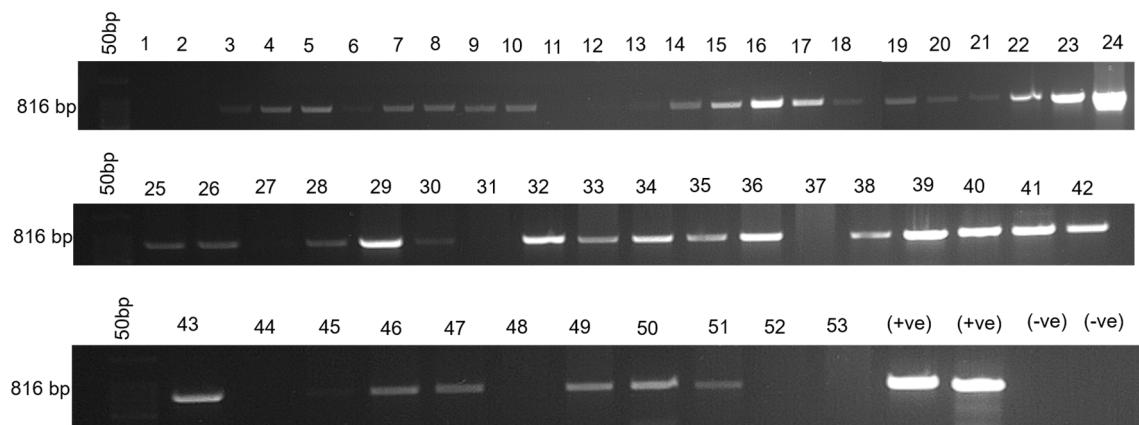

Supplementary Figure S4. Chromatograms confirming the CRISPR editing events of single and dual gene in tomato leaves tolerant to Fol 1332. A. Leaf 2 of single gene *XSP10* (SX), B. Leaf 2, leaf 3 of single gene *SISAMT* (SS), C. Leaf 4 of dual gene (DX) and D. Leaf 4, Leaf 5 of dual gene (DS). The blue arrow

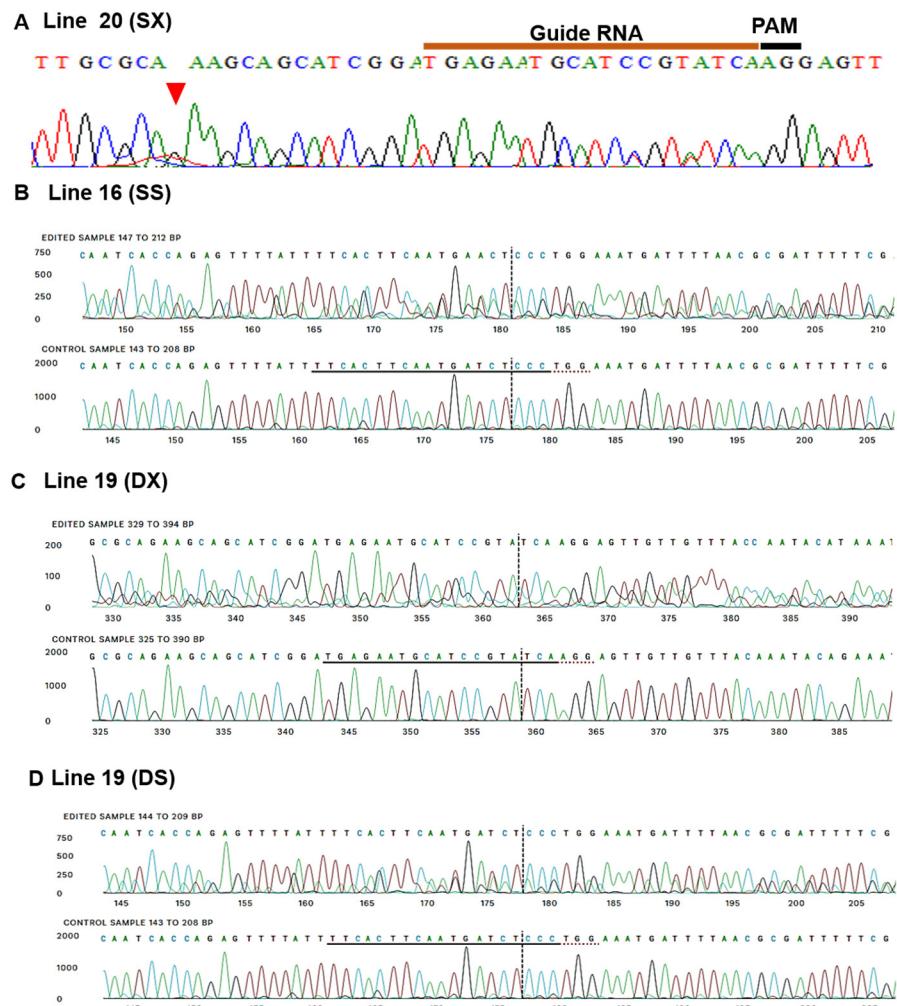

indicates base substitution (s), black arrow indicate insertion (+) and red indicate deletion (-). SX: Single gene editing of *XSP10*, SS: Single gene editing of *SISAMT*, DDX: Dual gene editing of *XSP10* (DX) and *SISAMT* (DS).

Supplementary Figure S5. Pathogen leaf disc assay for single gene CRISPR edited tomato leaves infected with *Fol* 1322 strain. Phenotypic analysis for *Fol* tolerance in single gene CRISPR edited tomato leaves of *XSP10* (SX) (B) and *SISAMT* (SS) (C) infected with *Fol* 1322 strain. WT leaves infected with *Fol* 1322 strain used as control (A). D. Graphical representation of the average mean area (mm²) of infected lesions of control wild-type (WT) and single gene CRISPR edited constructs in transient agro-infiltrated leaves of tomato. The area of lesions was measured by Image J software and the average size of lesion taken for statistical significance. Bars represent the average means \pm SE of measurements from 3 lesion spots from 3 different leaf discs of control and single gene CRISPR/Cas9 constructs. The asterisk denotes a significant difference determined by t-test ($P^*<0.05$). Single gene CRISPR editing of *XSP10* and *SISAMT* showed subtle phenotypic response against *Fol* infection. PID: Post infection day.

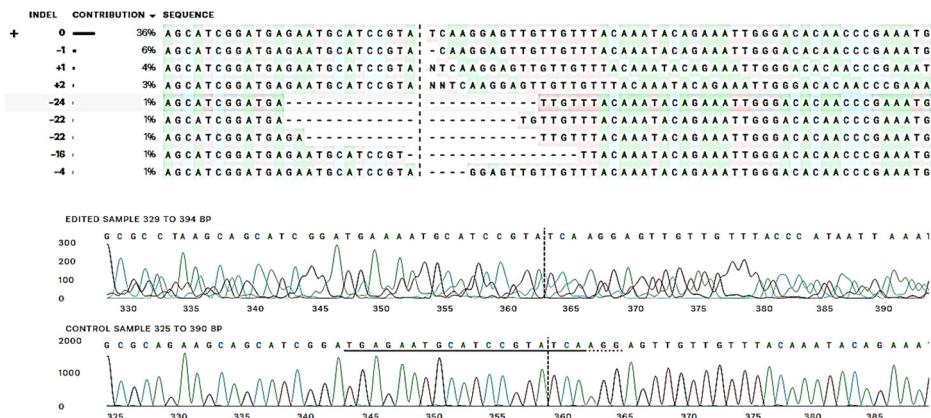

Supplementary Figure S6. Positive transformants of CRISPR/Cas9 construct at GE₀ generation in tomato cv. AV. PCR confirmation of CRISPR/Cas9 transformants using the Cas9 primers. (+ve) represents the Cas9 plasmid and untransformed genomic DNA of WT as (-ve) control.

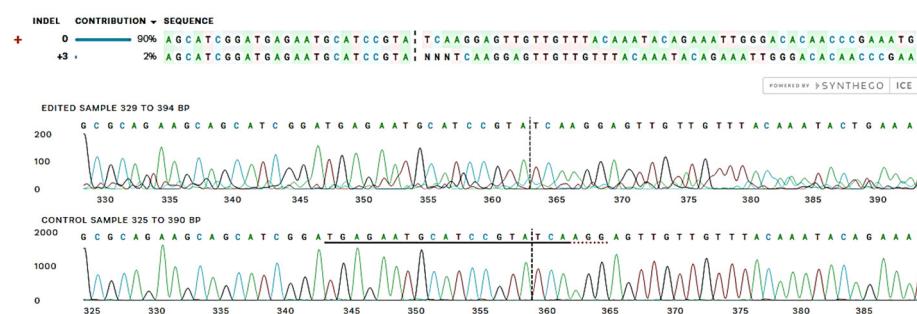

Supplementary Figure S7. Chromatograms confirming the CRISPR editing events of single and dual gene of tomato cv. AV at GE₀ generation. Dotted vertical represents cas9 cleavage sites and highlighted marks represents the guide RNA region.

Supplementary Figure S10. Sanger sequencing and chromatogram confirming the CRISPR editing events of single (SX and SS) and dual gene (DXS) of GE₁ generation from tomato cv. AV. Dotted vertical represents cas9 cleavage sites. Dashes represents deletions of nucleotides.

Supplementary Figure S11. *Fol* 1322 colonization in 10–12 days old seedlings of tomato cv. AV at 12 h and 24 h post-inoculation. **A.** Phenotypic observation of WT and CRISPR edited lines roots inoculated with *Fol* 1322 suspension culture. Roots treated with water (mock) were used as a control. **B.** Quantitative analysis of the intensity of root colonization by *Fol* 1322 was observed at 12 h and 24 h after inoculation. The red arrow marked represents the fungal hyphae attached to the root. The colonization intensity was measured as the area of mycelia against the total size of the image. The level of significance difference ($P^{***}<0.001$) was calculated by parametric student t-test using PRISM Graph Pad 9.0. Software. Scale bar 0.2 μ m.

Supplementary Figure S12. Single and dual-gene CRELs of *XSP10* and *SISAMT* showed reduced necrotic lesions upon *Fol 1322* infection in tomato leaves. **A.** Microscopic visualization of *Fol* infected 1 month old leaves of WT and CRELs stained with lactophenol trypan blue (a-f). Quantification of leaf cell death / mm² was counted with Image J software (g). **B.** DAB staining of WT and CRELs in 3-PID with *Fol 1322* (a-f). The H₂O₂ release / total area (mm²) was measured with Image J software (g). Data were collected from three independent biological replicates, and 3 leaves were used in each biological replicate. The average lesion areas are expressed as means ± standard errors (n = 3). All the data were statistically analyzed. Asterisks indicate significant differences compared to the control (Student's t-test, *P < 0.05, **P < 0.01, ***P < 0.001).
