

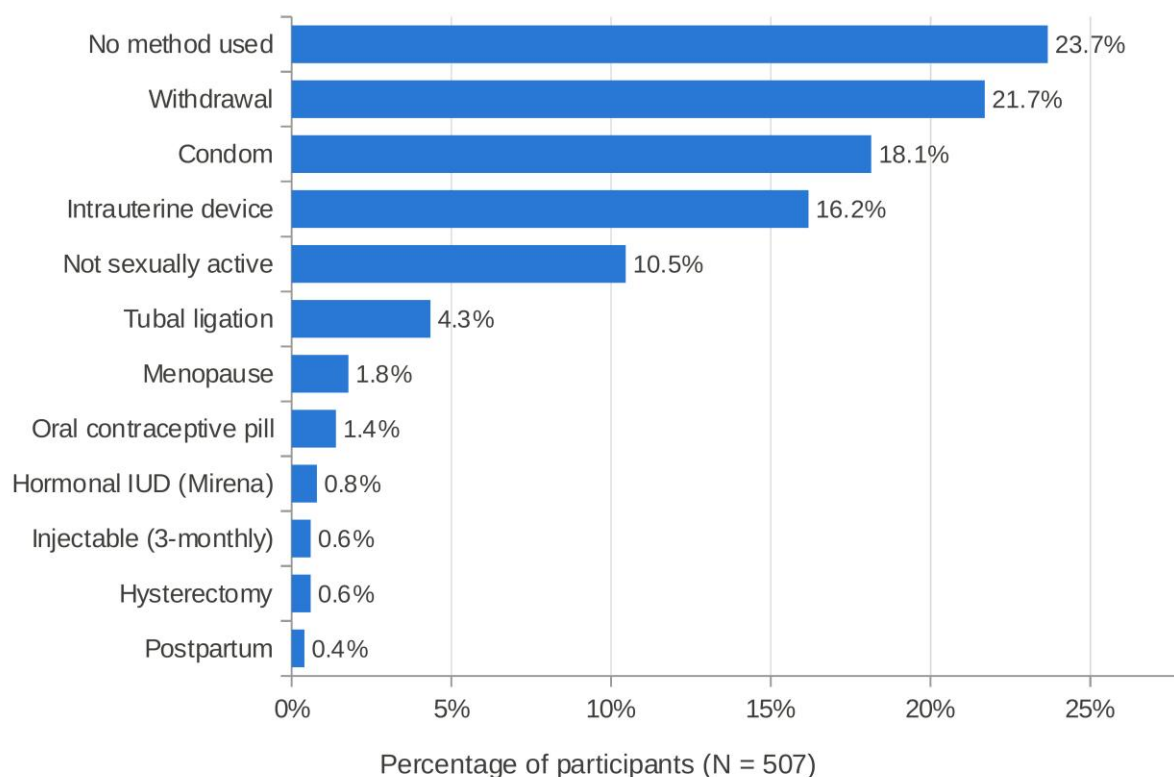

Figure S1. Contraceptive methods used and reasons for non-use (N = 507)

Percentages are based on all 507 participants. Menopause, hysterectomy, postpartum status and not being sexually active are reasons for not using a method. The questionnaire option for the intrauterine device did not specify the type of device, and the hormonal IUD (Mirena) was a separate option. No participant reported using a monthly injectable. The question is item 10 in Supplementary File S1. IUD, intrauterine device.
