

Supplementary Figure 5. barchart showing LsPRX genes differentially expressed in root and leaf under mycorrhization (LoP/-AM vs. LoP/+AM) and phosphorus supply (LoP/-AM vs. HiP/-AM). LoP/+AM= mycorrhized plants with suboptimal phosphorus according to their FC = fold change; HiP/-AM= plants grown with optimal phosphate concentration in nutrient solution and without AMS; LoP/-AM= plants grown with sub-optimal phosphate concentration in nutrient solution and without AMS.
