Analytical Methods

Passive samples VOCs analyses by TD-GC-MS.

The sampled cartridge analyses used a thermal desorption system (TD Unity Markes) coupled to gas chromatograph (HP 6890 Agilent). Thermal desorption of VOC was performed in several steps: The sampling tube was desorbed at 300°C and released VOCs were flushed to a trap. The trap was cooled to -10°C and purged with 30 ml.min⁻¹ helium flow. It was constituted of two adsorbents Carbotrap C and Carbopack B. In the second step the trap was heated at 290°C allowing the analytes to be split injected (1:40) with helium into the column. The helium flow was maintained at 0.8 ml.min⁻¹ and temperature program: 40°C/ 10°C.min⁻¹ / 230°C, hold 8 min was used. Adsorbent cartridges need to be conditioned at 350°C before use and residual mass average of the mass blank value for each compound of interest was determined by TD-GC-MS analysis.

Gas chromatograph was equipped with an analytical column DB-624 (60 m x 0,25 mm x 1.4 µm) and a mass spectrometer (MS HP5973) which was operated at full scan from 35 to 300 Daltons. The ionization method was electron impact (EI 70eV). VOCs were identified on their retention times and mass spectra and quantified by external calibration. For a few compounds that lacked authentic standard were tentatively identified and were calculated using toluene as a reference compound as below:

$$C_n = A_n / A_{toluene} \times C_{toluene} \quad (4)$$

Where:

A_n is the peak area of compound n

$A_{toluene}$ is the peak area of toluene

C_n is the concentration of compound n (ppbv)

$C_{toluene}$ is the concentration of toluene (ppbv) which was quantified by external calibration

Analytes were quantified using a calibration curve, based on the analysis of cartridges loaded and positive blank values subtracted from the analytical results. For each level of calibration 1 μ l of methanol standard solution or 1L of gas standard diluted in Silco Can canister was used. Detection limits were calculated from the standard deviation of blank values. For compounds for which blank value cannot be measured, the detection limit was estimated from the ratio between signal / noise observed in the analysis of a cartridge loaded with a mass about 0.3 ng.

TD-GC-MS analyses of canister samples.

In the laboratory the canister with sample was pressurized at 0.2 MPa with ultra-pure nitrogen and 2 liter samples were concentrated at 100 ml/min using restrictor on sorption tube Tenax TA+ Carbograph TD-1+ Carboxen 1003 for VOCs analyses. Tenax TA + Sulficarb tubes were used for thiols analyses (Markes). The conditions of TD-GC-MS analyses were the same as described above, but in this case splitless injection was used.

HPLC analyses of carbonyls.

The sampled material was eluted from the cartridges by washing with 2 ml acetonitrile and diluted with 2 ml of ultrapure water and 80 μ L of the sample was injected. Analytes were separated on an analytical column Ascentis RP-Amide, 15 cm x 4.6 mm x 3 μ m (Supelco) with C₁₈ guard column 4 mm x 3 mm (Phenomenex). Gradient elution at flow 1.4 ml/min was used from 100% A (acetonitrile/water 40:60), to 100% B (acetonitrile/water 75:25) and detected by HPLC-UV/VIS detector at 365 nm. A hydrazone standard mixing solution containing formaldehyde, acetaldehyde, acetone, acrolein, propionaldehyde, crotonaldehyde, methacrolein, 2-butanone, butanal, isobutanal, benzaldehyde, cyclohexanone, isovaleraldehyde, valeraldehyde, o-tolualdehyde, m-tolualdehyde, p-tolualdehyde, glutaraldehyde, hexanal, dimethyl benzaldehyde, heptanal, octanal, nonanal, decanal (Supelco, Sigma Aldrich) was used for external calibration. Butyraldehyde and isobutyraldehyde, benzaldehyde and cyclohexanone, p-tolualdehyde and m-tolualdehyde could not be separated on the used analytical column and were reported as butyraldehyde, benzaldehyde and p-tolualdehyde respectively.

Standards used for analysis of other VOCs.

Commercial mixtures of volatile compounds in nitrogen and in methanol and neat standards (dissolved in the laboratory in methanol) were used for calibration. EPA 524 VOC MIX A (0.2 mg/ml methanol, Supelco), Aldehyde standard mix (1 mg/ml methanol, Chromservis), 1,2,3,4-tetramethylbenzene (0.100 mg/ml methanol, Dr. Ehrenstorfer), Ozone precursors – Scott Air (100 ppb/m³ N₂, Restek), Mercaptans–Scott Air (1 ppm/m³ N₂, Restek), 1,1,2-trichloro-1,2,2-trifluoro ethane, (Freon 113) (1.0 mg/ml MeOH, Supelco), ethyl acetate, butyl acetate, methyl-isobutyl ketone, 2-butanone, limonene, α -pinene, 1-butanol, 2-pentanone, propionic acid, methyl butyrate, benzoic acid, benzene, ethylbenzene, toluene, m-xylene, p-xylene, o-xylene, styrene, pentane, n-butanal, methylcyclopentane, heptane, methylcyclohexane (Sigma Aldrich). Analytical characteristics for quantitative standards are shown below in Table S2.

Table S2. VOC standards used for external calibration.

<u>Carbonyls</u>	Calibration range ng/l	LOQ (ng/l)	Uncertainty (%)
Butanal	1.04-8.33	1.0	8.15
3-methylbutanal	1.04-8.33	1.0	7.64
