**Figure S1.** Map of Switzerland showing the seven regions.

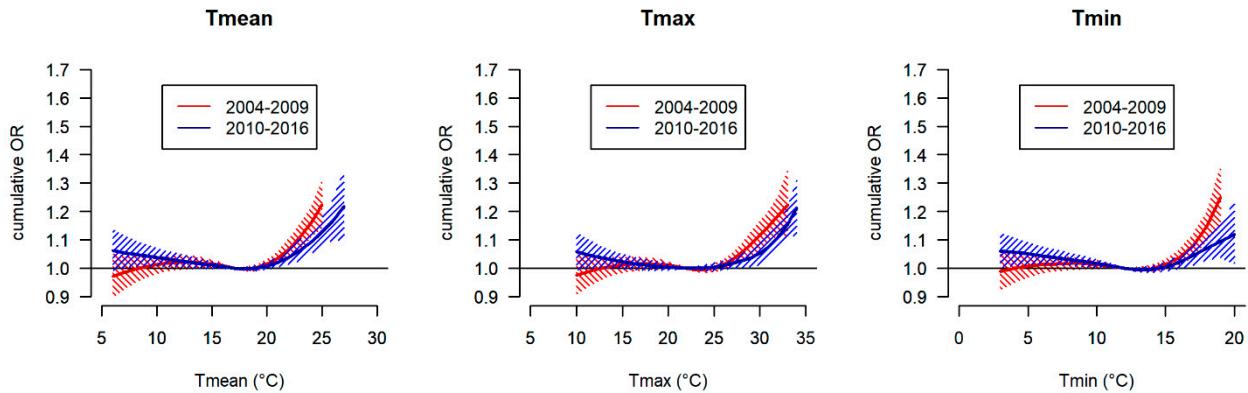

Boundaries: Swisstopo (2020), swissBOUNDARIES3D (accessed 03 February 2020).

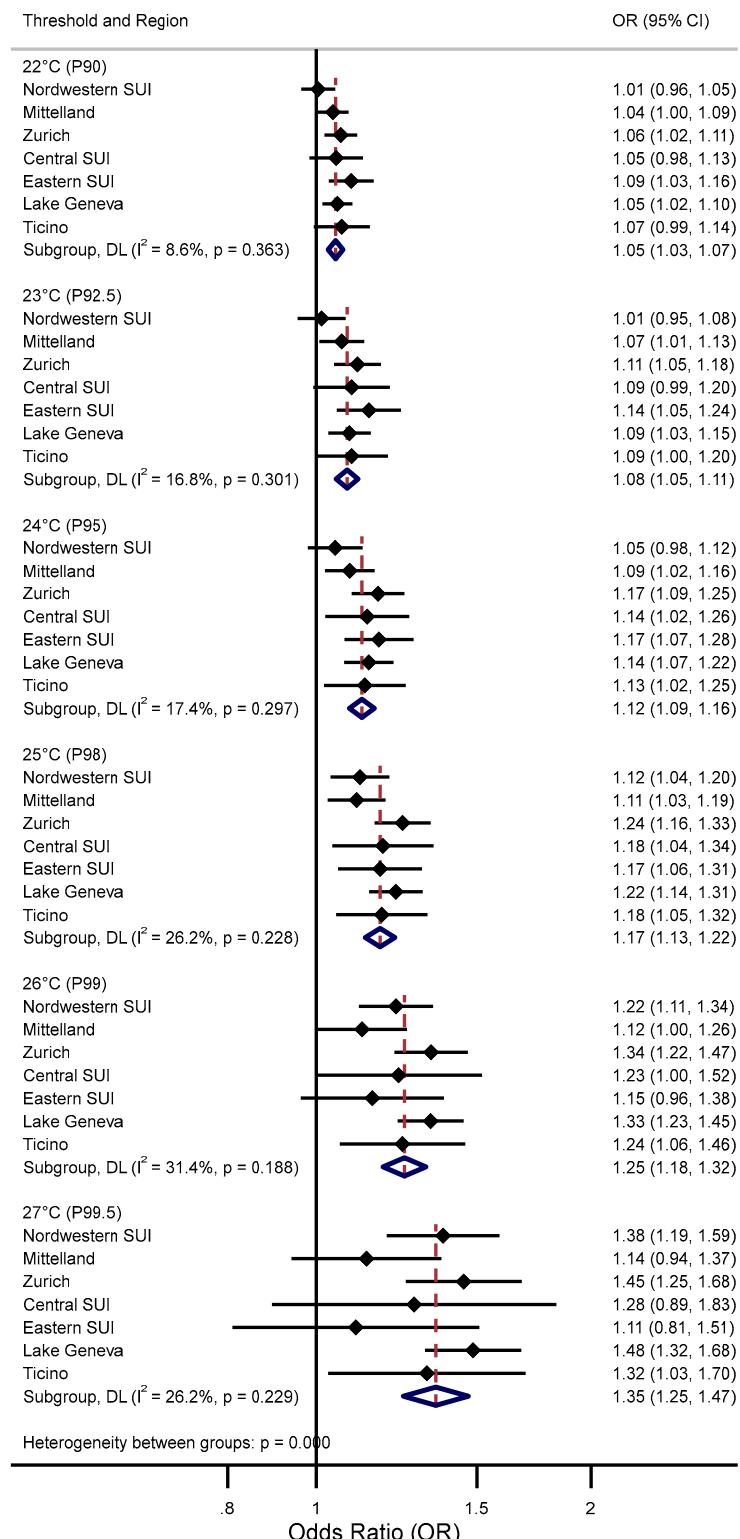

**Figure S2.** Odds ratios (ORs) of mortality associated with daily mean (Tmean), daily maximum (Tmax), and daily minimum (Tmin) temperature in Switzerland during the warm season (May–September) for two age categories. Plots in the first row show the cumulative exposure–response association with 95% confidence interval over one week (lags 0–7). Plots in the second row show the lag-specific ORs with 95% confidence intervals at the 98<sup>th</sup> percentile of the warm-season temperature distribution in respect of the median warm-season temperature.

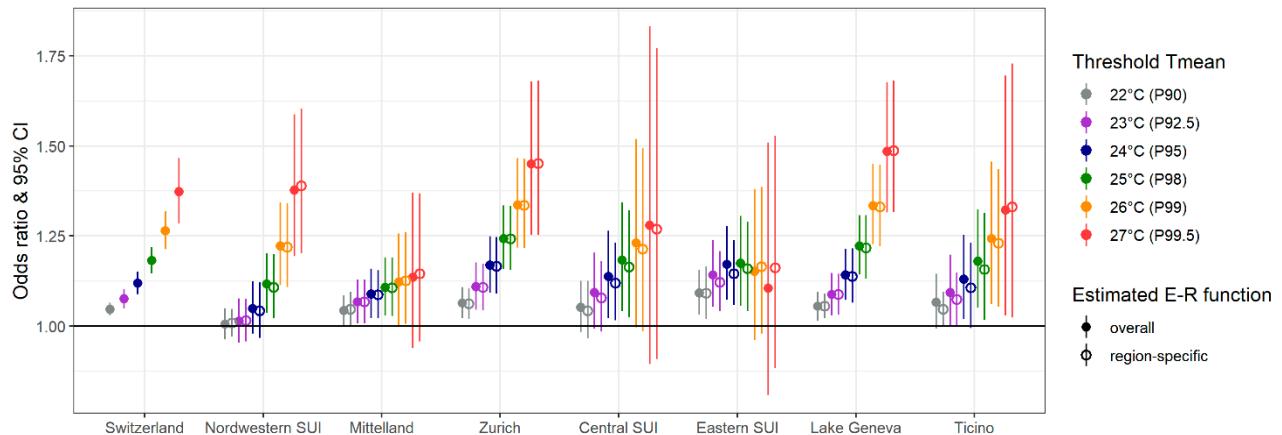

**Figure S3. Odds ratios (ORs) of mortality with 95% confidence interval associated with daily mean (Tmean), daily maximum (Tmax), and daily minimum (Tmin) temperature in Switzerland during the warm season (May–September) of two time periods (2004-2009 and 2010-2016). The year 2003 was excluded from the analyses.**

**Figure S4: Forest plot of region-specific Odds Ratios (ORs) of mortality associated with various daily mean temperature (Tmean) thresholds in Switzerland.** ORs are reported for a cumulative 7-day lag and are estimated based on overall (i.e., using the overall median Tmean as reference) model parameters. Threshold temperatures are shown as absolute values and as percentile (P) corresponding to the temperature distribution of the warm season in Switzerland between 2003 and 2016.

**Figure S5: Estimates of cumulative odds ratios (ORs) of mortality at various daily mean temperature (Tmean) thresholds with respect to median warm-season Tmean in Switzerland and the seven regions during 2003-2016.** ORs are reported for a cumulative 7-day lag and are estimated based on overall (i.e., using the overall median Tmean as reference) and region-specific model parameters (i.e., using the region-specific median Tmean as reference). Percentiles (P) of threshold temperatures refer to the Tmean distribution across total Switzerland.

**Table S1. Cumulative Odds Ratios of mortality over 0-7 days for various temperature (T) thresholds of daily mean (Tmean), daily maximum (Tmax), and daily minimum (Tmin) temperature in relation to the respective median of the warm-season temperature distribution. ORs are shown for the total population and two age groups.**

**Table S4. Cumulative Odds Ratios (ORs) over 0-7 days associated with various temperatures of daily mean (Tmean), daily maximum (Tmax), and daily minimum (Tmin) temperature during the time periods 2004-2009 and 2010-2016 in relation to the respective median of the warm-season temperature distribution (Tmean: 17 °C both periods; Tmax: 22 °C both periods; Tmin: 12 °C both periods). The year 2003 was excluded from the analyses.** P-values represent the test for equality between the two time periods (Chi-square test, significance level <0.05).
