

## Supplementary Figure legends

**Supplementary Figure S1. Post-operative serum PD-L1 does not correlate with clinicopathological characteristics**

Post-operative serum PD-L1 levels do not differ between different TNM status (A-C) and moderately or poorly differentiated tumors (D). Patients with a complete (R0) tumor resection have significantly lower post-operative PD-L1 serum levels. Post-operative PD-L1 serum levels are unaltered between male and female patients (F) and patients with different ECOG performance status (G).

**Supplementary Figure S2.** Serum PD-L1 negatively correlates with pro-malignant circulating cytokines

Preoperative serum PD-L1 levels show a negative correlation with serum levels of CCL1 (A), CCL21 (B), CCL25 (C) and CCL26 (D).
