

Supplementary Fig. S1

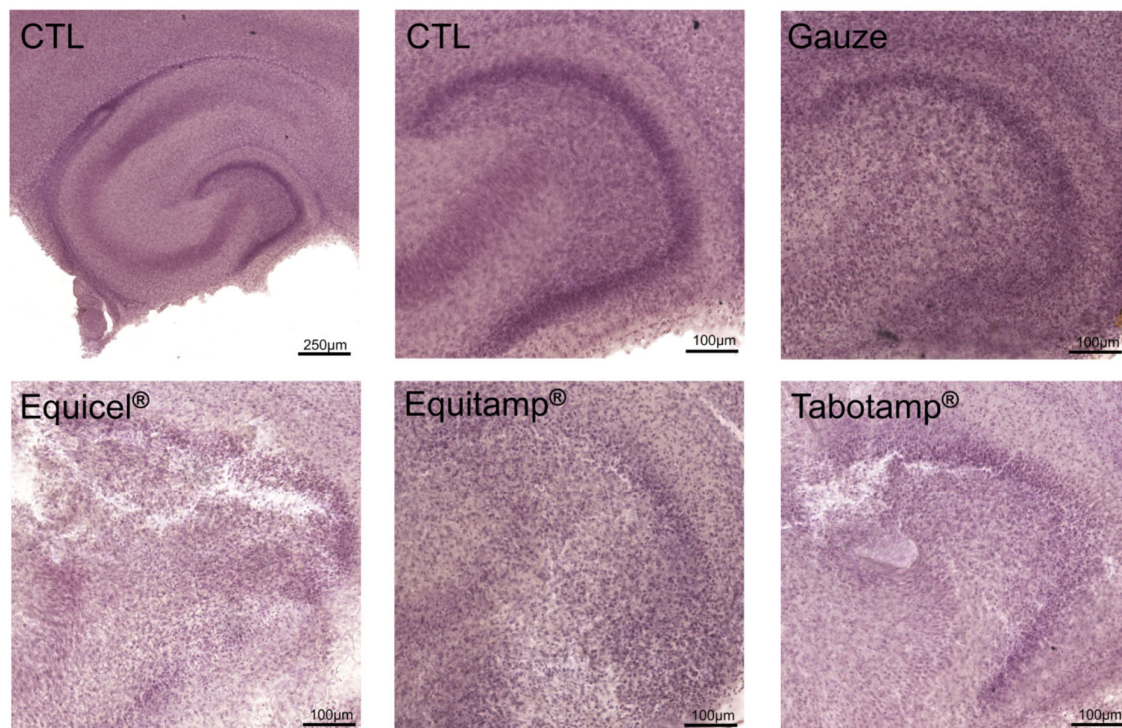

Figure S1. Hematoxylin staining of OHSC. In the control group (CTL) and after treatment with the gauze, a very well preserved cytoarchitecture is shown in which the hilus region as well as the dental gyrus are well recognizable. Especially after Equicel® and Tabotamp® treatment, numerous pyknotic nuclei and a clearly changed cytoarchitecture were observed. In contrast, Equitamp® treated groups achieved a better preserved cytoarchitecture. Bars = 250 µm (left upper picture) or 100 µm.
