

Supplement Figure S1. The protein association networks of downregulated proteins ($p<0.01$) from the proteomic analysis data.

Supplement Figure S2. The colony morphologies after the 24 h incubation of wound fluid (the representative picture of figure 10C), using 5 μ L of the wound fluid on the 3rd day of experiments diluted by normal saline solution (NSS) with the ratio between the wound fluid versus NSS at 1:1 to 1:10⁴ (dilution 10⁰ to 10⁻⁴), in LB (Luria-Bertani) agar (the non-selective culture media) (A) demonstrates the larger colonies in the wound fluid from *P. aeruginosa* parent strain (PACL) compared with the Chlorhexidine (CHG)-treated strain (C_PACL) (the small variant colonies of C_PACL were visually separated) with the Gram-negative bacilli. Additionally, the characteristics of wound at the 14th day of experiments as indicated by histological scores (B) and the representative Hematoxylin

& Eosin (H&E) stained pictures from the wounds without or with bacterial administration tissues (C-E) are also demonstrated (n = 5-7 per group).

Supplement Table S1. Up-regulated proteins in *P. aeruginosa* biofilm after CHG treatment ($p<0.001$).

Protein ID	Gene name	Protein name	Fold change
