²Faculty of Engineering and Sciences, Universidad Adolfo Ibáñez. Millennium Nucleus for the Development of Super Adaptable Plants (MN-SAP). Center of Applied Ecology and Sustainability (CAPES), Santiago, Chile.

Figure S1. Semi-quantitative RT-PCR to detect *AtzDof1.3* in L4080 tissues.

Figure S2 Leaf sugar content in control and transgenic tomato line L4080.

Figure S3. Total sugar content in the developing fruit of control and transgenic tomato line L4080.

Figure S4 Total N and the Carbon-to-N ratio in control and L4080 plants grown under varying N.

Figure S5 Root characteristics of tomato control and transgenic Line 4080.

Figure S6 Pictures of mature control and L4080 tomato plants in the greenhouse.

Figure S7 PCR amplification of *AtDof1.3* orthologue *SlDof17* in wild tomato species.

Figure S8 Physiological comparison of wildtype *Arabidopsis* and *AtDof1.3* T₄ (T-DNA insert line).

Table S1. Relative levels of metabolites in fruit pericarp sampled at different developmental stages in the control and L4080.

Table S2. Changes in gene expression using the GeneChip® Tomato Genome Array.

Table S3. Identification of the predicted *cis*-elements motifs in promoters of Dof-regulated genes.

Table S4. Members of the Dof gene family with proven roles in altering metabolism and storage product accumulation.

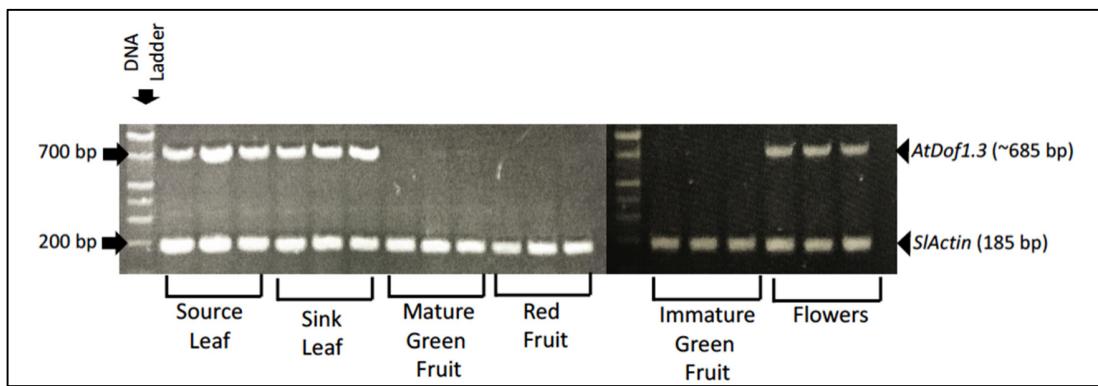

Figure S1. Agarose gel showing the semi-quantitative RT-PCR products of *AtDof1.3* and actin amplified from different L4080 tissues. Each RT-PCR reaction consisted of three biological samples derived from RNA harvested from three separate plants. Actin was included in the reaction as a housekeeping control. There was no amplification of *AtDof1.3* in the non-transformed control line (data not shown).

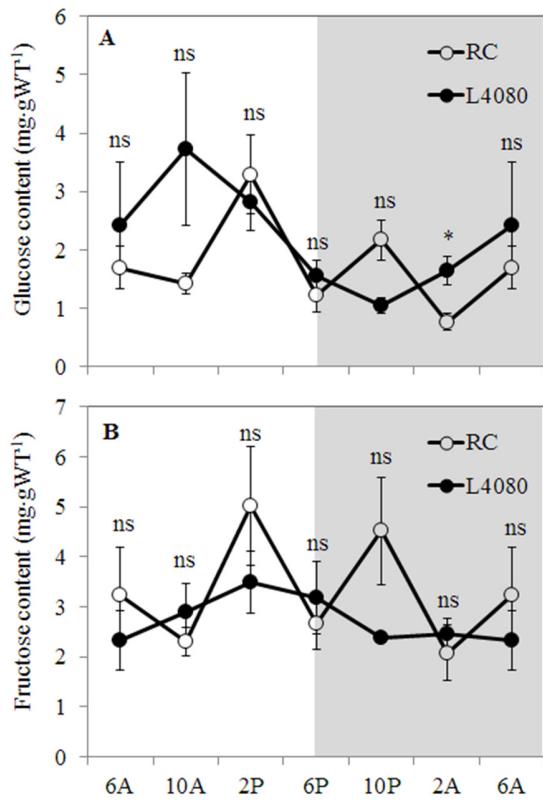

Figure S2. Leaf sugar content in control and transgenic tomato line L4080. Changes in leaf carbohydrate content (g.FWT⁻¹) during the diel, where the shaded area represents the night period. **A.** Glucose, **B.** Fructose. Data is the mean \pm SEM of 6 biological replicates. An asterisk indicates data points differing between genotypes ($P < 0.05$). ns = not significant. L4080 is the AtzDof1.3 line, and RC- is the untransformed control.

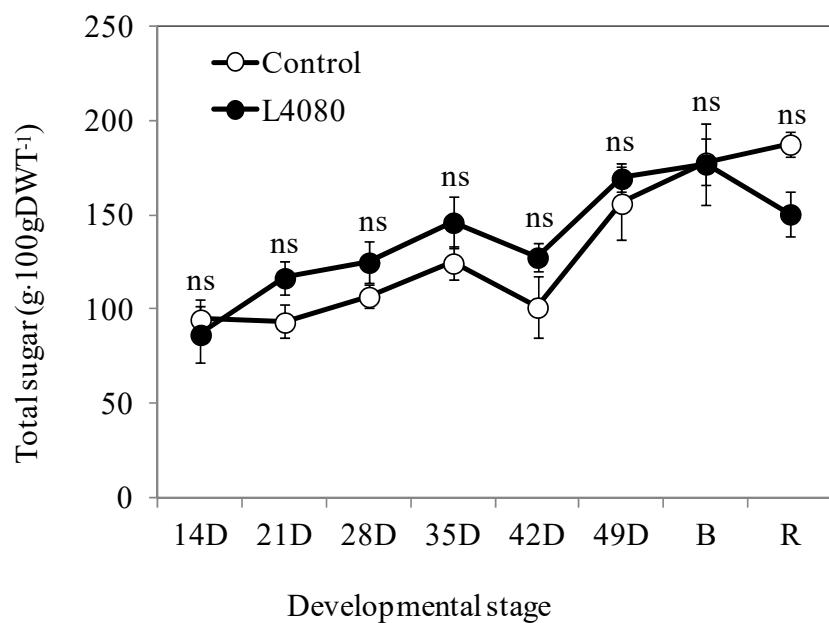

Figure S3. Total sugar content in the developing fruit of control and transgenic tomato line L4080.
Fruit carbohydrate assayed in the pericarp taken at 7-day intervals during fruit development. DPA – days post anthesis, B- fruit at Breaker stage ~ 63 DPA and RR red ripe ~70 DPA.

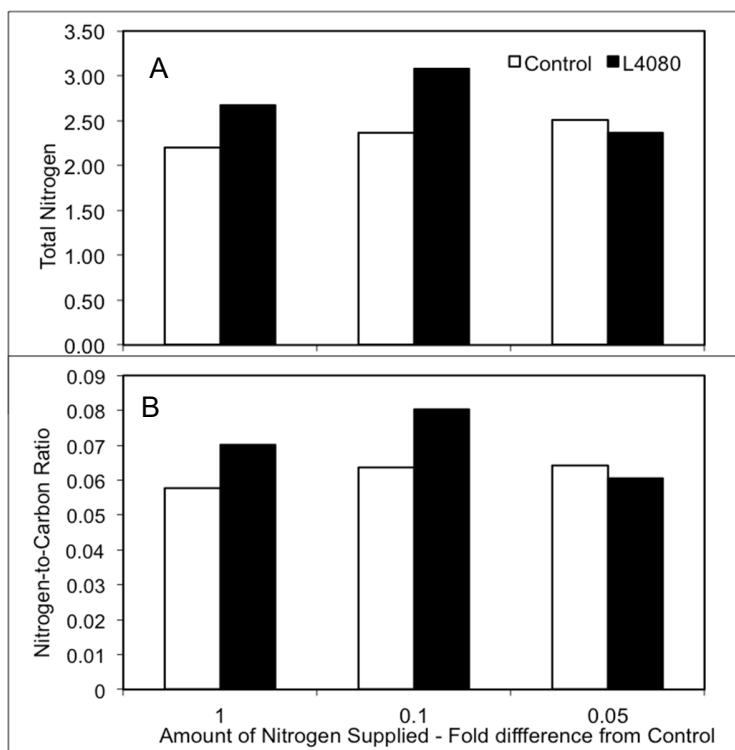

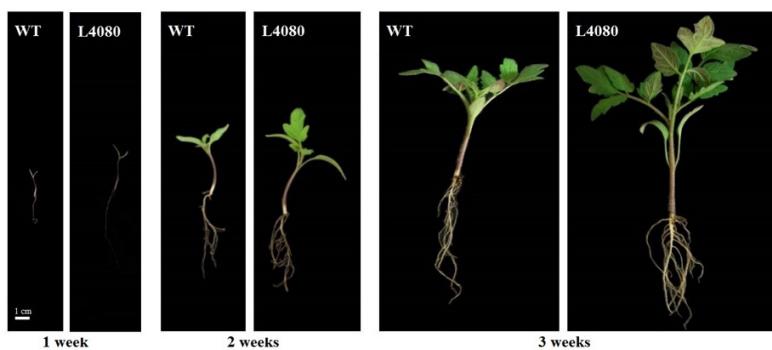

Figure S4. Total N (A) and the Carbon-to-N ratio (B) in control and L4080 plants grown under varying N. Six plants of each genotype, grown under each condition was ground and analyzed. Data is for duplicate samples.

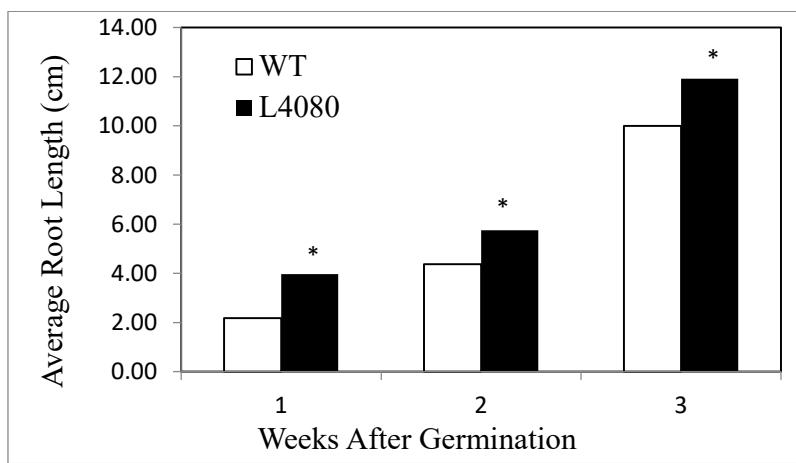

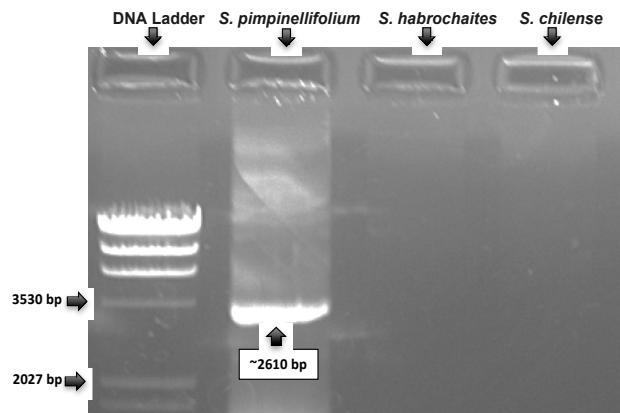

Figure S5. Root characteristics of tomato control and transgenic Line 4080. Six plants of each genotype were used for each week of measurement. Plants were grown in one-gallon pots to promote free growth of roots. The plants were carefully extracted from the soil, washed in deionized water, and blotted dry with paper towels. **A)** Each plant was photographed, and representative plants of each genotype are shown. **B)** Root length was measured by taking a digital image and counting the length of the main lateral root in pixels. This measurement considers that the roots are not straight. An ANOVA was performed on the data using SAS9.1.3 (**Figure 2.3**) (Cary, NC).

Figure S6. Pictures of mature control and L4080 tomato plants in the greenhouse. Plants were pruned to 2 fruit per inflorescence and terminated after the 9th truss. There was no significant

difference in plant height, leaf area, rate of leaf appearance, number of trusses when the data collected from 12 plants were averaged.

Primer Name	Primer Sequence
s49	CCCATCTTACCCCTTTCA
as885	CATCACCAAGATCAAACATCAAAG
s1021	TCAGATCGTGAGGGTAGC
s1786	AGCAGGTGAGTTGAAGCAG
as1846	TCCATTGTCCTGAAGCAG
s2440	TTCACTCGTGGTACAATGC
as2830	AAACTCAGCTGCATCTTATTATCTC

Figure S7. PCR amplification of wild tomato genomic DNA using *SIdof17* primers. A. PCR product amplified using primers s247 and as2830. There was no amplification from *S. habrochaites* or *S. chilense*. B, C. The sequences and primer location relative to each other on *SIdof17*. These different primer combinations were used for various PCR reaction. In our hands, there was no amplification of an orthologue from the wild species. Genomic DNA was extracted from *S. pimpinellifolium*, *S. habrochaites*, *S. chilense*, and *S. lycopersicoides* (not shown). The PCR product was purified using QIAquick gel extraction kit (Qiagen) and ligated into pGEM® T Easy Vector (Promega) for sequencing. *SIdof17* in *S. lycopersicum* (Sequence ID:) were downloaded from NCBI. The multiple sequences alignment was done using the Clustal Omega <http://www.ebi.ac.uk/Tools/msa/>; (accessed February 25th 2017).

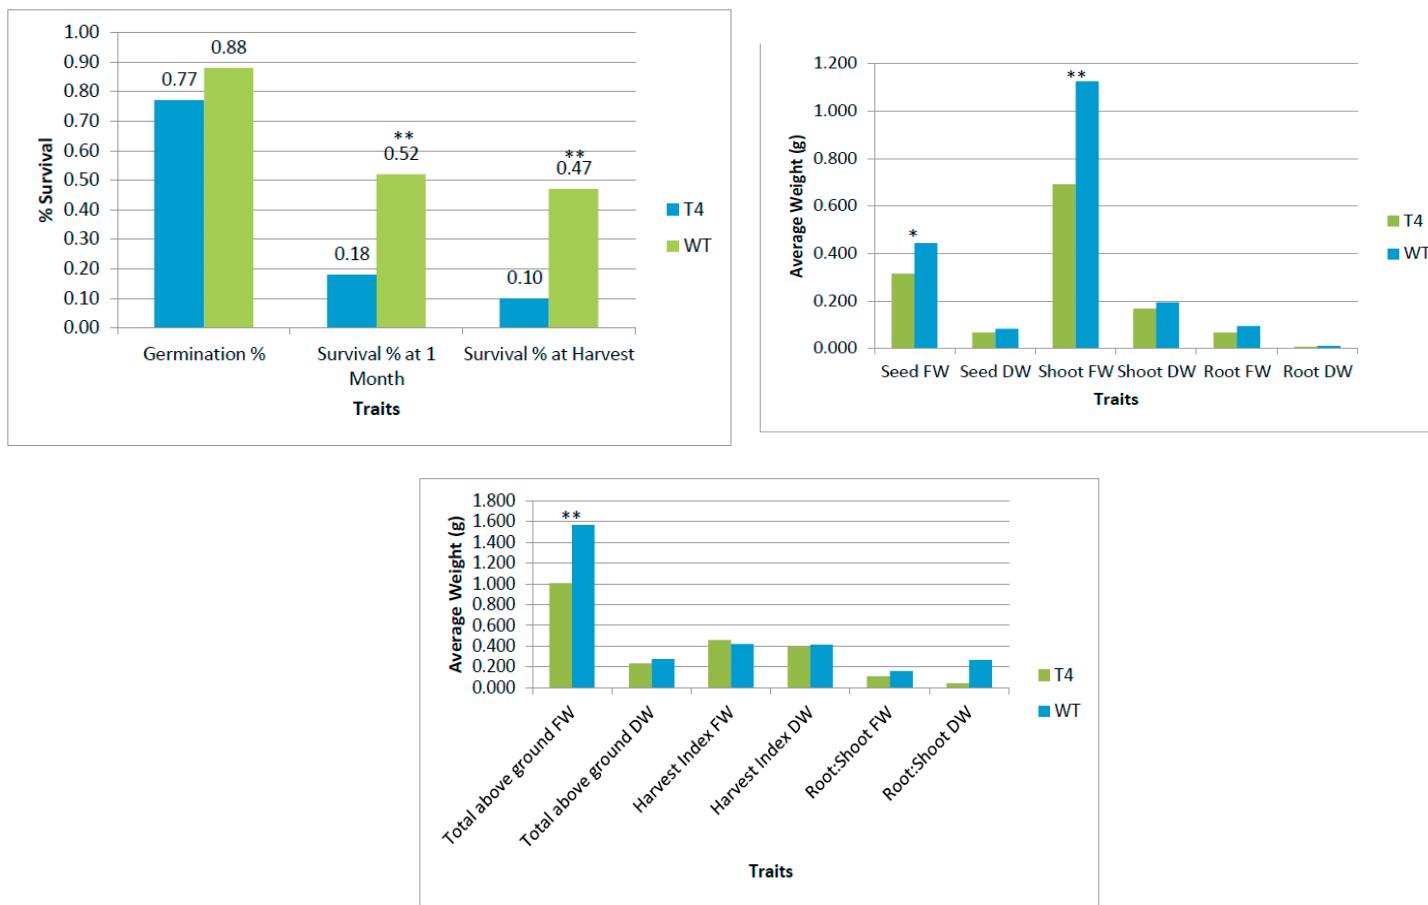

Figure S8. Physiological comparison of wildtype *Arabidopsis* (WT) and *AtDof1.3* T₄ (T-DNA insert line –T4). A. Average percentages of germination, survival at one month (32 days) and survival at harvest (61 days) **B.** Analyses of individual plant tissue average weights . **C.** Total biomass and ratios of multiple tissues. * indicates a *p*-value of <0.065, while not significant, is suggestive; ** indicates a significant *P*-value of <0.05. This experiment was performed with at least six plants for each genotype for each trait. For dry weight, tissue was dried for 48 hours at 60°C. To analyze the data, an ANOVA was performed using SAS9.1.3 (Cary, NC).

Table S1. Relative levels of metabolites in fruit pericarp sampled at different developmental stages in the control and L4080. Emboldened values differ ($p<0.05$).

Table S2. Changes in gene expression using the GeneChip® Tomato Genome Array. This analysis was performed on leaves harvested at 12 h light (noon) in 6-week-old plants. Affymetrix ID, corresponding Genbank and Tomato Accession ID from SolGenomics network, function and Gene Ontology Annotation are given. cDNAs were listed if they varied at least 1.5-fold from the control at $p<0.01$.

Affymetrix ID	<i>p</i> -Value	Fold	Genbank ID	Tomato Accession (iTAG2.4)	Gene description based on iTAG2.4 ID	Function	Gene Ontology

Table S4. Members of the zDof gene family with proven roles in altering metabolism and storage product accumulation. The sequence of each gene was identified, analyzed by BLAST to find the closest Arabidopsis homologue and the subclass determined.

Species	Gene	Gene role in storage product accumulation	Arabidopsis homologues	Dof Sub Group	Ref*
Soybean	<i>GmDof4</i>	Increase fatty acids and lipids content when overexpressed in soybean.	AT5G60850	A	[1]
Soybean	<i>GmDof4</i>	Enhance lipid content when expressed in <i>Chlorella ellipsoidea</i> .	AT5G60850	A	[2]
Soybean	<i>GmDof11</i>	Increase fatty acids and lipids content when overexpressed in soybean.	AT2G46590	C2.1	[1]
Maize	<i>ZmDof1</i>	Increase C and N assimilation under low N when expressed in rice.	AT1G07640	B1	[3]
Maize	<i>ZmDof36</i>	Increase in starch accumulation	AT3G45610	C2.1	[4]
Wheat	<i>TaDof1</i>	Increase expression level under low N in wheat.	AT2G37590	B1	[5]
Rice	<i>OsDof25</i>	Increase ammonium transporters level and affect N metabolism when overexpressed in Arabidopsis.	AT2G37590	B1	[[6]]
Arabidopsis	<i>Dof1</i>	Increase N assimilation under low N when overexpressed in tobacco.	AT1G51700	A	[7]
Sweet	<i>SRF1</i>	Higher starch, less sugar when overexpressed in sweet potato.	AT5G39660	D1	[8]
Canola	<i>BnDof5.6</i>	Decrease fatty acid content and alter seed fatty acids composition in a <i>BnDof5.6</i> down-regulated canola line.	AT5G62940	C1	[9]
Kiwifruit	<i>AdDof3</i>	Starch degradation during fruit ripening.	AT2G37590	B1	[10]
Tomato	<i>AtCDF3</i> <i>/AtDof3.3</i>	Ectopic overexpression in tomato increased fruit and vegetative biomass and improved plant response under limited and sufficient N	AT3G47500	D1	[11]
Tomato	<i>SiCDF4</i>	Overexpression in tomato increased fruit yield and vegetative biomass and improved plant response under limited and sufficient N	Not reported	D	[12]
