

**Supplementary Figure S1.** Fold change in miR-200c expression in pooled urines from patients with different glomerular diseases. Expression is given as fold change compared to control urine. Urines were normalized to Cel-miR-9, which was spiked into the urines prior to RNA isolation.

**Supplementary Figure S2.** Position and binding site of miR-200c to different 3'UTR regions. Position and binding site of miR-200c to ZEB1 (A), ZEB2 (B) and VEGF-A (C).
