# Tissue Oxygen Adaptation of Bone Marrow-Derived Mesenchymal Stromal Cells Enhances Their Immunomodulatory and Pro-Angiogenic Capacity, Resulting in Accelerated Healing of Chemical Burns

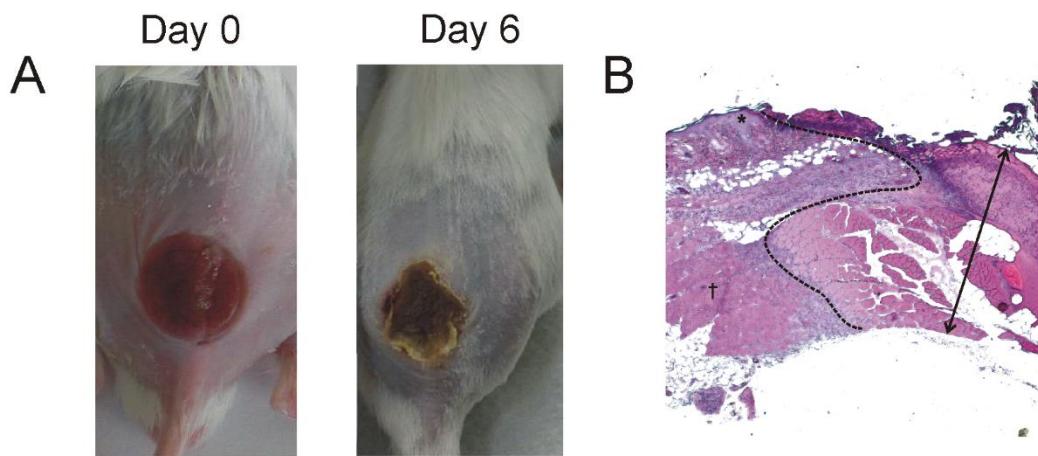

## Supplementary Information

**Table S1.** Primary eschar desquamation and re-epithelialization rates.

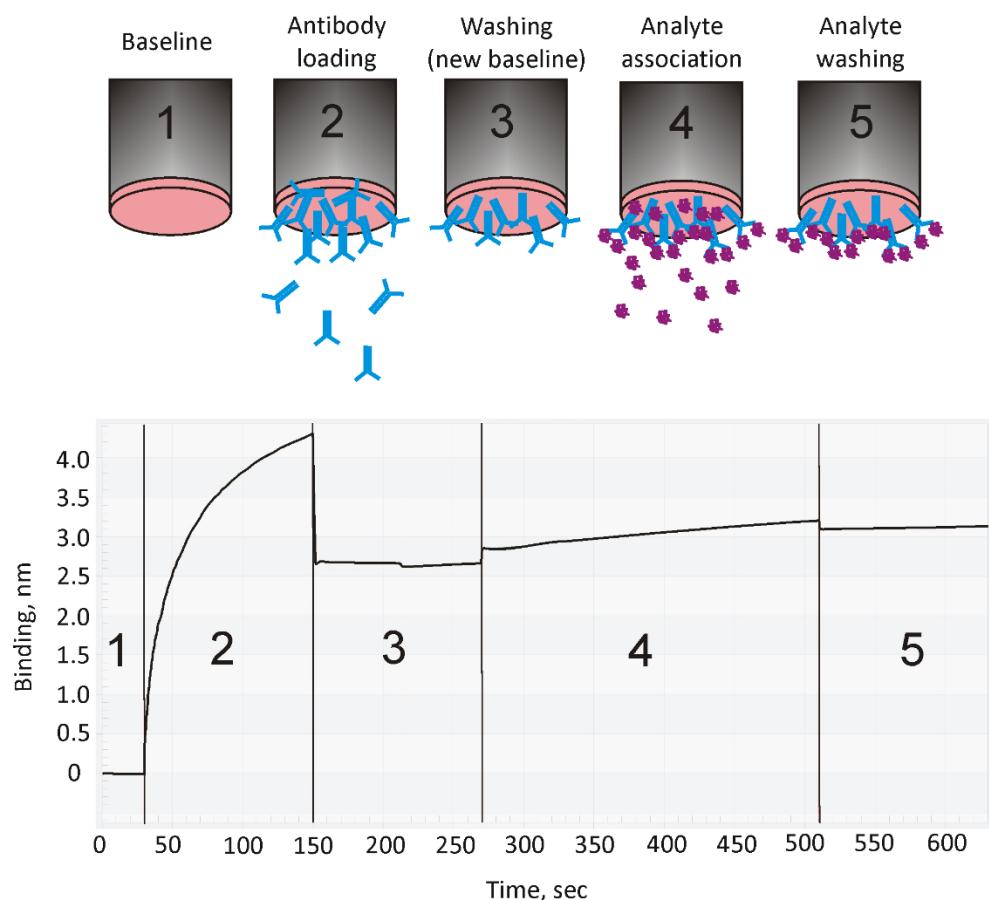

Group	Primary eschar desquamation rate, %			Re-epithelialization rate on day 28, %
	Day 14	Day 23	Day 28	
Saline	28,6	71,4	85,7	85,7
21 % oxygen MSCs	0	42,9	85,7	85,7
5 % oxygen MSCs	14,3	100	100	100

**Figure S1.** Characteristics of alkali burn wounds on Balb/c mice model. (A) Images of the alkali burns immediately after injury and on day 6. (B) Image of histological section of the wound and adjacent healthy tissues on day 6 after alkali burn. The border between non-damaged and necrotic tissue is outlined with black dashed line. Double-headed arrow shows full-skin necrosis and necrosis of underlying *panniculus carnosus* (asterisk) muscle. Black star indicates formation of migrating epithelial tongue in the wound edge.

**Figure S2.** The scheme of bio-layer interferometry measurement of VEGFA binding. The procedure includes 5 steps: 1 – baseline registration (in PBS); 2 – immobilization of antibodies to VEGFA (ab52917, Abcam) on a biosensor with conjugated protein A; 3 – washing out the unbound antibodies and registration of a new baseline; 4 – detection of VEGFA in the sample; 5 – washing out the unbound VEGFA.
