

Supplementary

Essentiality of the *Escherichia coli* YgfZ protein for the in vivo thio-methylation of ribosomal protein S12 by the RimO enzyme.

Torben Lund, Maria Yohanna Kulkova, Rosa Jersie-Christensen, and Tove Atlung*

Department of Science and Environment, Roskilde University, Denmark

Figure S1. Bacterial strains TC5540 (wt) and TC5541 (*rimO*) were grown in LB medium at 37 °C. Samples were taken for MS analysis at the points indicated by arrows, at OD600 of 0.2, 0.7 and 2.5 and processed as described in the experimental section.

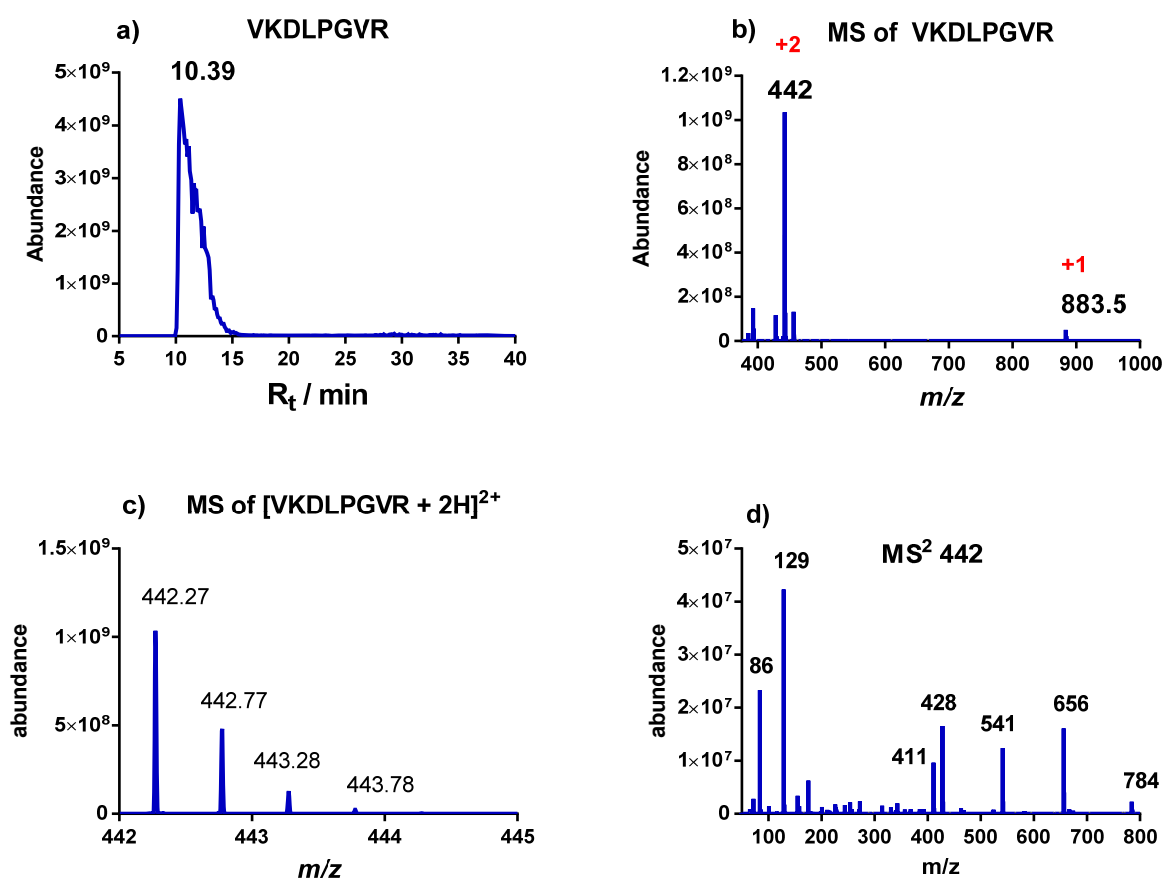

Figure S2: Commercially purchased non-thiomethylated VKDLPGVR used as a standard reference. a) HPLC chromatogram a sample of VKDLPGVR with observed retention time of the peptide peak at 10.39 min. b) ESI-MS spectra of VKDLPGVR showing the single and double charged ions of the peptide . c) Illustrates the ^{13}C isotope distribution (mass difference of 1/2) that proves double charge ion (+2) state. d) Chromatogram shows the MS² of m/z =442. The following fragment ions are observed: 129 (iminium ion of R), 428 (y4), 541 (y5), 656 (y6).

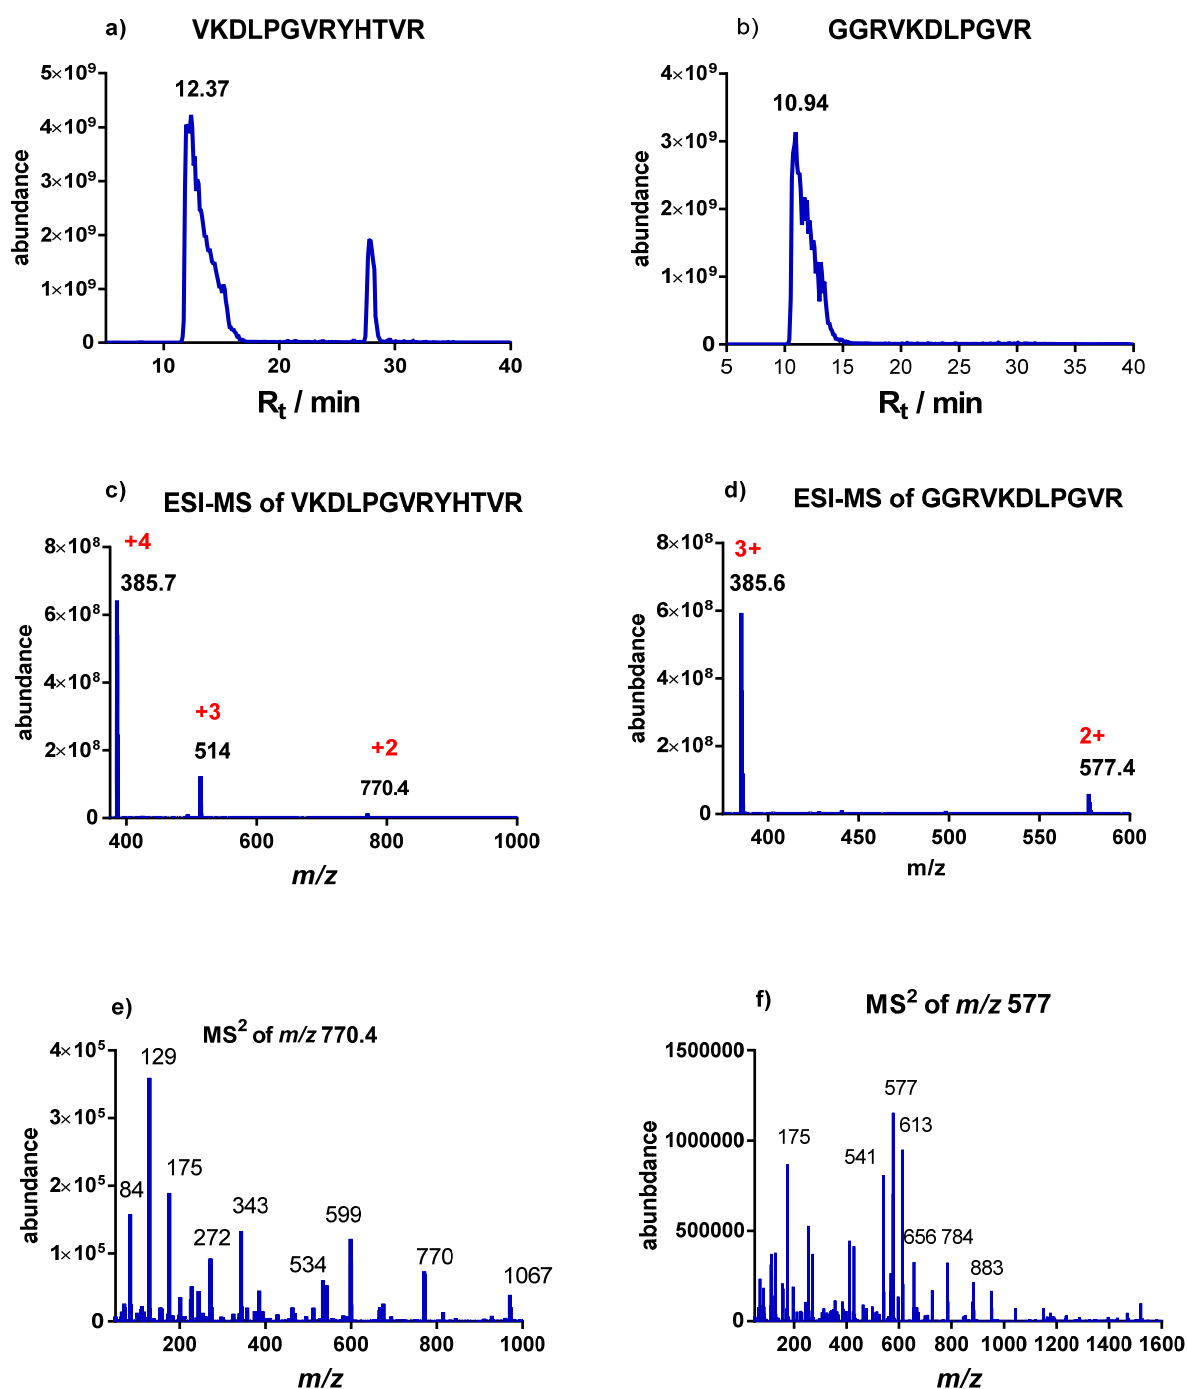

Figure S3: Commercially purchased non-thiomethylated two miscleaved S12 peptides containing D88. a), b) HPLC chromatograms of the two peptides VKDLPGVRYHTVR and GGRVKDLPGVR c),d) ESI-MS spectra of the two peptides. e), f) MS^2 of the double charged ions $[M+2H]^{2+}$ of the two reference peptides.

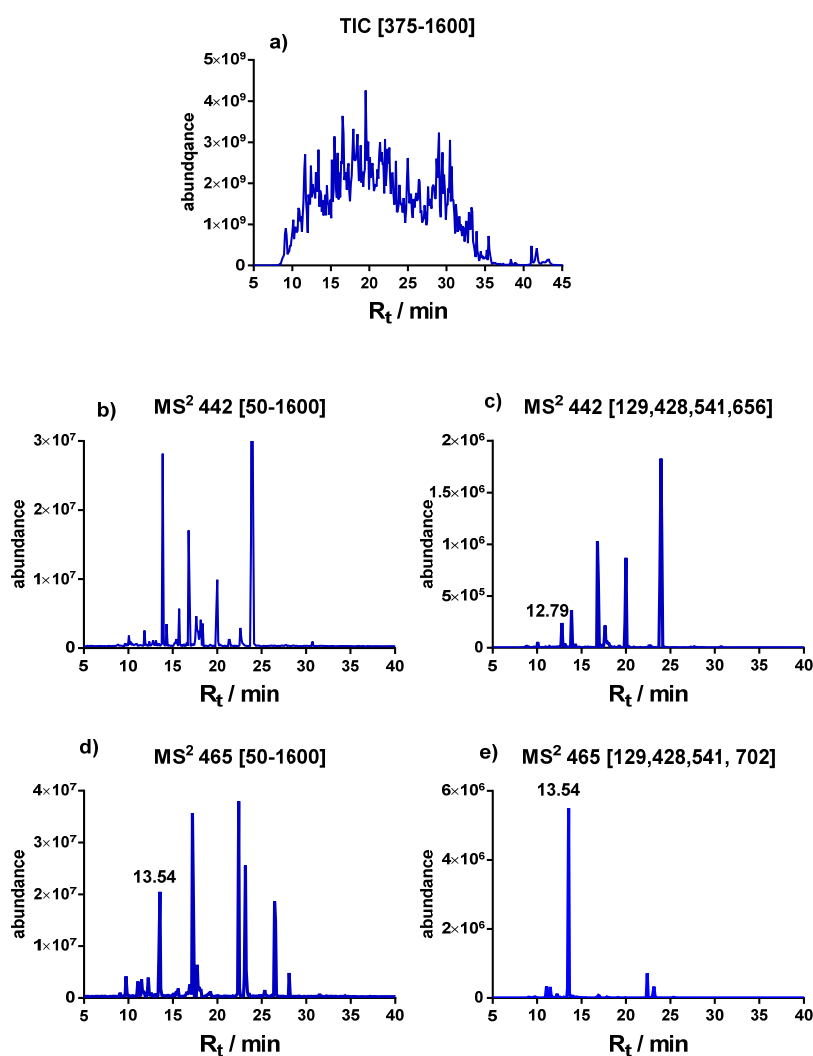

Figure S4 Targeted LC-MS analysis of a trypsin treated wild type bacterial *E. coli* sample. a) Total Ion Chromatogram (TIC) in the m/z interval [375-1600]. b),c) Chromatograms of the non thiomethylated VKDLPGVR peptide sample with the MS² filters, MS² 442.27@hcd 35 [50-1600] and MS² 442.27@hcd 35 [129,428,541,656], respectively. d), e) Chromatograms obtained of the thiomethylated VK**D**LPGVR peptide with the MS² filters, MS² 442.27@hcd 35 [50-1600]MS² 465.26@hcd 35 [129, 428, 541,702], respectively.

Table S1: Percent S12 thiomethylation in wild type (wt), *rimO* and *ygfZ* bacterial strains grown at 30-42 °C and harvested at different bacterial growth phases.

Bacterial strain	Geno-type	OD ₆₀₀	t/°C	Biological Replicates	Area VKDLPGVR	Area VKDLPGVR	$\frac{VKDLPGVR}{VKDLPGVR}$
