

Supplementary figures

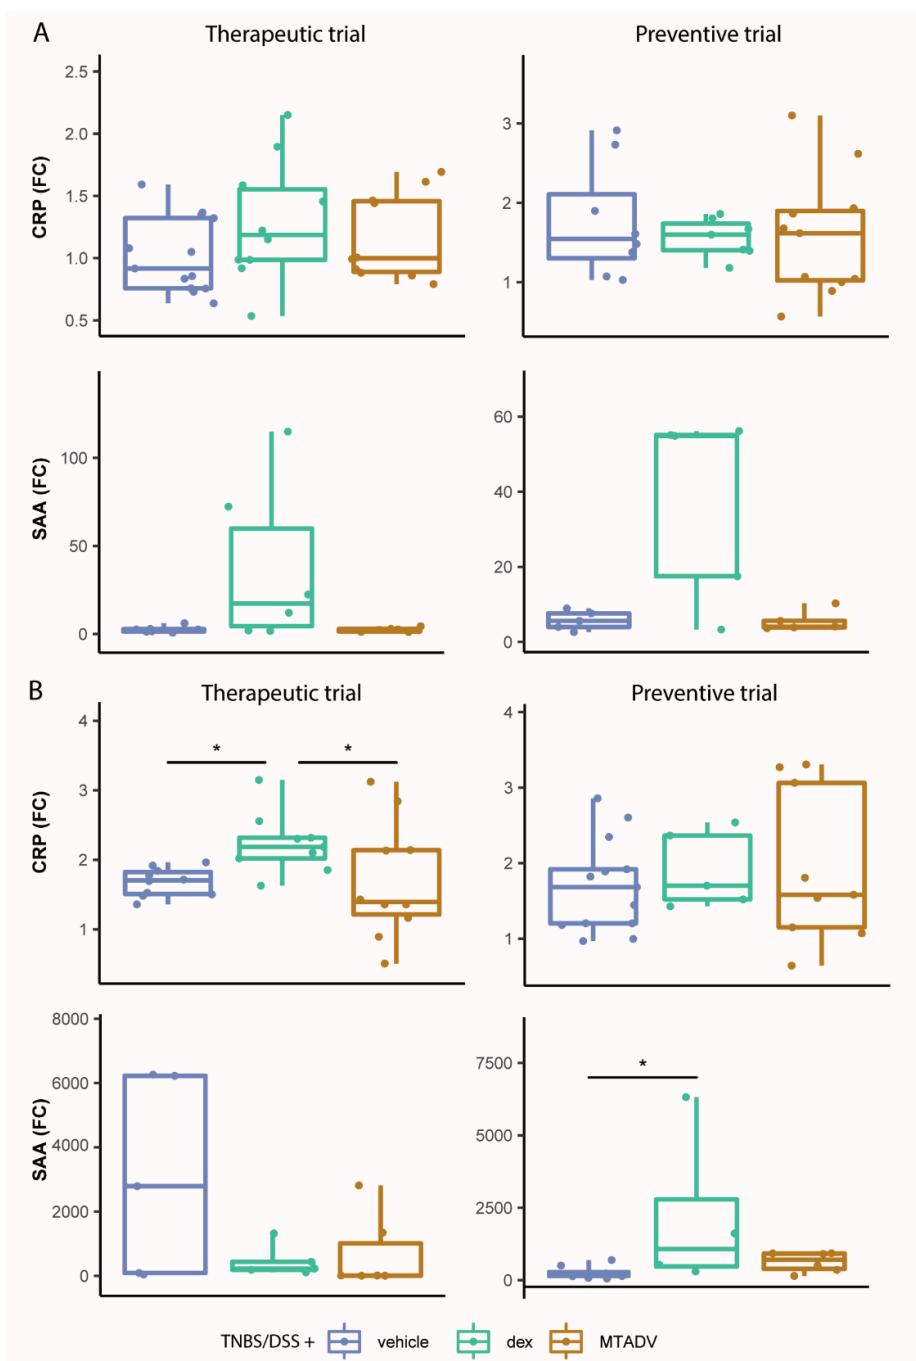

Figure S1. Concentration of plasmatic APP in each treatment group. APP protein concentration is expressed as ng/ml for CRP and ug/ml for SAA for both therapeutic and preventive trials in the TNBS (A) and DSS (B) models. Data are represented as points summarized in boxplots indicating IQR and bars indicating maximum and minimum. The median point is depicted as a bar inside the box. Treatment groups are differentiated using colours. Asterisks mark significance between the groups indicated by lines (Kruskall-Wallis test with a post-hoc Dunn's test). Significance levels are: * $p\text{-value}\leq 0.05$; ** $p\text{-value}\leq 0.01$; *** $p\text{-value}\leq 0.001$. APP, acute-phase protein; CRP, C-reactive protein; dex, dexamethasone; DSS, dextran sulphate sodium; FC, fold change; IQR, interquartile range; SAA, Serum Amyloid Antigen; MTADV, 5-MER peptide methionine-threonine-alanine-aspartic acid-valine; TNBS, trinitrobenzenesulfonic acid.

Supplementary tables
