

Figure S1. HRW increased cucumber root growth under chilling stress. (A) root fresh weight. (B) root dry weight. (C) root surface area. (D) root volume. (E) root diameter. Values are the means \pm SD, n = 9 (number of samples). The different letters indicate a significant difference ($p < 0.05$). These indicators were measured after 72 h of chilling stress.

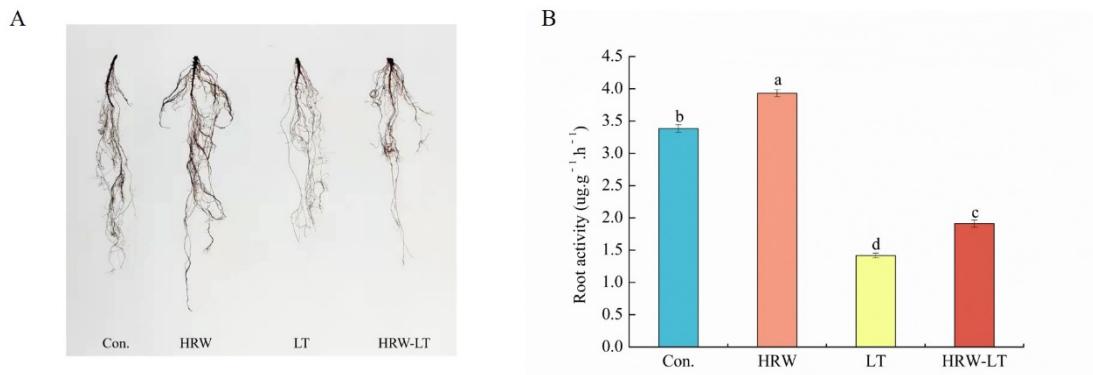

Figure S2. HRW enhanced cucumber root vitality under chilling stress. (A) root staining. (B) root vitality. Data were the mean \pm standard deviation of three biological replicates. The different letters indicate a significant difference ($p < 0.05$). These indicators were measured after 72 h of chilling stress.

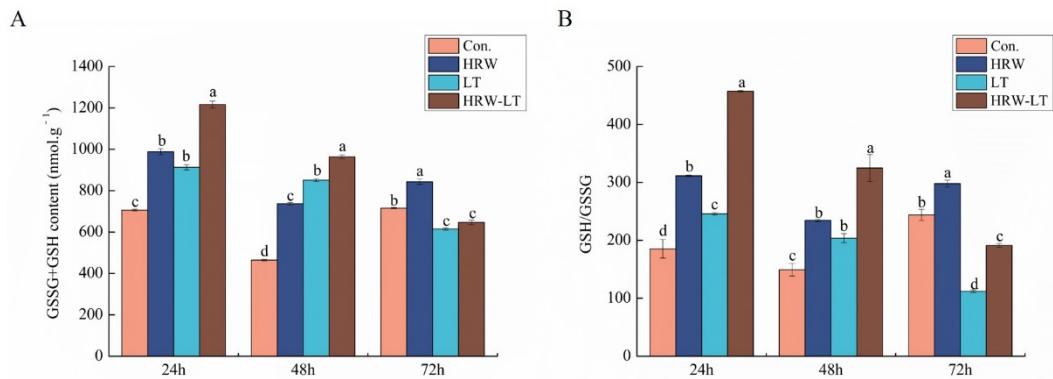

Figure S3. HRW effected cucumber GSH+GSSG content and GSH/GSSG under chilling stress. (A) GSH+GSSG content. (B) GSH/GSSG. Data were the mean ± standard deviation of three biological replicates. The different letters indicate a significant difference ($p < 0.05$).
