

Supplementary Figure S1. Volcano plot of MS identified proteins. Proteins with high FDR confidence and at least 2 unique peptides are shown in the graphs. Red dots indicate the proteins that changed significantly compared to the control sample (0.05<p-value, Fold Change ≥1.33). The y-axis indicates the -log 10 of the p-values, the x-axis indicates the ratio of either directly irradiated (A: 0.1Gy, B: 3Gy) or EV-treated samples (C: BM+0.1Gy EV, D: BM+3Gy EV) and their controls.
