**Table S1.** List of the classical classifiers with their main characteristics.

- CalibratedClassifierCV(LinearDiscriminantAnalysis())`: Linear Discriminant Analysis (LDA) is a classifier with a linear decision boundary, generated by fitting class conditional densities to the data and using Bayes' rule. The model fits a Gaussian density to each class. `CalibratedClassifierCV` is a probability calibration with isotonic regression or sigmoid.
- `CalibratedClassifierCV(QuadraticDiscriminantAnalysis())`: Similar to LDA but Quadratic Discriminant Analysis (QDA) allows for the decision boundary to be quadratic.
- `DecisionTreeClassifier()`: A decision tree classifier builds a model in the form of a tree structure, making decisions based on feature values.
- `ExtraTreeClassifier()`: An extremely randomized tree classifier, this algorithm randomizes certain decisions and thresholds more than a regular decision tree, adding additional randomness to the model.
- `DummyClassifier()`: This is a classifier that makes predictions using simple rules, and is useful as a simple baseline to compare with other (real) classifiers.
- `RandomForestClassifier()`: A forest of randomized decision trees, often yielding highly accurate predictions.
- `BaggingClassifier()`: Bagging (Bootstrap Aggregating) is a way to decrease the variance of the prediction by generating additional data for training from dataset using combinations with repetitions to produce multisets of the same size as the original.
- `ExtraTreesClassifier()`: Extra Trees is like a Random Forest, in that it builds multiple trees and splits nodes using random subsets of features, but with two key differences: it does not bootstrap observations (meaning it samples without replacement), and nodes are split on random splits, not best splits.
- `AdaBoostClassifier()`: The core principle of AdaBoost is to fit a sequence of weak learners (i.e., models that are only slightly better than random guessing) on repeatedly modified versions of the data.
- `GradientBoostingClassifier()`: Gradient Boosting builds an additive model in a forward stage-wise fashion; it allows for the optimization of arbitrary differentiable loss functions.
- `LogisticRegression()`: Logistic regression, despite its name, is a linear model for classification rather than regression. It is also used in the last layer of Neural Network models.
- `SGDClassifier()`: Linear classifiers (SVM, logistic regression, etc.) with SGD training. SGD stands for Stochastic Gradient Descent: the gradient of the loss is estimated each sample at a time and the model is updated along the way with a decreasing strength schedule (aka learning rate).
- `RidgeClassifier()`: Classifier using Ridge regression. This classifier first converts the target values into {-1, 1} and then treats the problem as a regression task (multi-output regression in the multiclass case).
- `RidgeClassifierCV()`: Ridge classifier with built-in cross-validation.
- `PassiveAggressiveClassifier()`: Passive Aggressive algorithms are online learning algorithms. Such an algorithm remains passive for a correct classification outcome, and turns aggressive in the event of a miscalculation, updating and adjusting.
- `LogisticRegressionCV()`: Logistic regression CV (Cross-Validation) classifier.
- `Perceptron()`: The Perceptron is another simple classification algorithm suitable for large scale learning.
- `BernoulliNB()`: Naive Bayes classifier for multivariate Bernoulli models.
- `GaussianNB()`: Gaussian Naive Bayes (GaussianNB) classifier. Can perform online updates to model parameters via the `partial_fit` method (for details on algorithm used to update feature means and variance online, see Stanford CS tech report STAN-CS-79-773).
- `KNeighborsClassifier()`: Classifier implementing the k-nearest neighbors vote.
- `NearestCentroid()`: Nearest ,Centroid is a simple algorithm representing each class by the centroid of its members. It also has no parameters to choose, making it a good baseline classifier.

- `MLPClassifier()`: Multi-layer Perceptron classifier. This model optimizes the log-loss function using LBFGS or stochastic gradient descent.
- `LabelPropagation()`: Label Propagation classifier is a semi-supervised learning method that propagates labels from the labeled to the unlabeled data.
- `SVC(probability=True)`: C-Support Vector Classification. The implementation is based on libsvm. The fit time complexity is more than quadratic with the number of samples which makes it hard to scale to datasets with more than a couple of 10000 samples.
- `LinearSVC()`: Linear Support Vector Classification. Similar to SVC with parameter kernel='linear', but implemented in terms of liblinear rather than libsvm, so it has more flexibility in the choice of penalties and loss functions and should scale better to large numbers of samples.

Methanococcus maripaludis strain S2, complete sequence GenBank: BX950229.1: c1269120-1269048 tRNA-Gly

Figure S1. Top: Representation of the two forms (ring and inside hairpin) of the circular RNA AL (for Archetypal Loop) built from the most frequent nucleotides of the tRNA-Gly loops of

Archaeota. Inside the ring on the left of the hairpin, consensus tRNA-Gly secondary structure of yeast and mammalian tRNA-Gly's, with in red nucleotides different from the corresponding ones in the tRNA-GlyGCC of Methanococcus maripaludis; Bottom: tRNA-GlyGCC of M. maripaludis with AL-nucleotides in red.

Table S2. List of tRNA-Gly$_{GCC}$ from 246 species extracted from GtRNAdB (http://lowelab.ucsc.edu/GtRNAdb/) with indication (in red) of the pentamers shared with AL.

Above list of 246 species is extracted from GtRNAdB (http://lowelab.ucsc.edu/GtRNAdb/), which contains 18,047 tRNA-Gly^GCC from 4,857 species: Eukaryota 599 12.3%, Archaea 220 (4.5%) and Bacteria 4,038 (83.1%). The 241 species are the only from the 4,857 species which have both the pentamers TGCCA in the anticodon loop and TTCAA in the Tψ-loop of their tRNA-Gly^GCC cloverleaf structure. The high proportion of Archaea (54/246 = 22%) is due here to the primitive character of the AL-decamer *TGCCATTCAA*. The remaining part of AL, *GATGAATGGTAC*, occurs in articulation and D-loop of the cloverleaf.

Table S3. List of nucleolin AL-proximity for 22 species.

| 22 Species with Nucleolin mRNA	AL-pentamer proximity
Solanum lycopersicum nucleolin (NCL) LOC101260453, mRNA NCBI Sequence: XM_010326160.3	18.1σ
Hydrotalea sandarakina nucleolin (NCL) str. DSM 23241 LX80DRAFT, GenBank: QKZV01000007.1	16.8σ
Gallus gallus nucleolin (NCL), transcript variant X1, mRNA NCBI Sequence: XM_046898333.1	13.2σ
Bauhinia variegata nucleolin (NCL) isolate BV-YZ2020 chromosome 1, GenBank: JAKRYI020000001.1	13σ
Homo sapiens nucleolin (NCL), mRNA NCBI Sequence: NM_005381.3	11.8σ
Lactobacillus lindneri nucleolin (NCL) DSM 20690 = JCM 11027, GenBank: FUXS01000002.1	11.7σ
Hydrobacter penzbergensis nucleolin (NCL) strain DSM 25353, GenBank: FNNO01000007.1	11.5σ
Ornithorhynchus anatinus nucleolin (NCL), mRNA NCBI Sequence: XM_029064618.2	11σ
Acanthochromis polyacanthus nucleolin (NCL) LOC110950732, mRNA NCBI Sequence: XM_022193488.2	10.8σ
Bactrocera dorsalis nucleolin (NCL) Fly_Bdor chr. 5 ASM2337382v1, mRNA NCBI Sequence: NC_064307.1	10.7σ
Monodelphis domestica nucleolin (NCL), variant X2, mRNA NCBI Sequence: XM_056819948.1	9.4σ
Xyrauchen texanus nucleolin (NCL) LOC127639553, mRNA NCBI Sequence: XM_052121621.1	9.3σ
Cannabis sativa nucleolin (NCL) chromosome 1, cs10, mRNA NCBI Sequence: NC_044371.1	9.3σ
Xenopus laevis nucleolin L homeolog (NCLL), mRNA NCBI Sequence: NM_001372137.1	8.8σ
Arabidopsis thaliana nucleolin like 2 (NUC-L2), mRNA NCBI Sequence: NM0_01338347.1	7.5σ
Dicentrarchus labrax nucleolin (NCL) LOC127349869, mRNA NCBI Sequence: XM_051375928.1	6.9σ
Helianthus annuus nucleolin (NCL) cultivar HA300 chromosome 17, GenBank: JANJOV010001181.1	6.9σ
Exophiala nucleolin (NCL) sp. JF 03-4F unplaced genomic scaffold EDD36 scaffold_3, GenBank: MU404352.1	6.8σ
Raphanus sativus nucleolin-like (NCL) cultivar WK10039 chromosome 4, GenBank: JRUI03000004.1	6.5σ
Cyprinus carpio nucleolin-like (NCL) LOC109082092, mRNA NCBI Sequence: XM_042712222.1	6.25σ

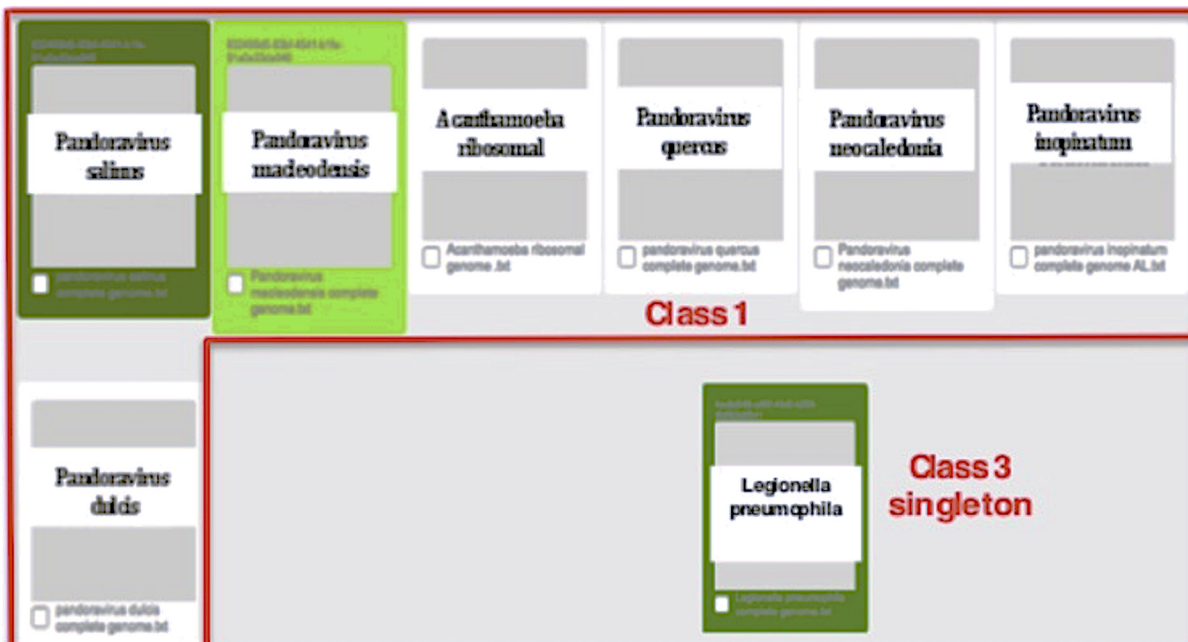

Figure S2. A) Class 2 from the classification by Maxwell of the Giant viruses, their virophages and infectious targets showing together Mimivirus, its virophage Zamilon and its target Acanthamoeba. B) Class 1 of the same classification bringing together genomes of the Pandora family plus its target Acanthamoeba castellanii. The class 3 contains a Bacterium Legionella pneumophila, for which Acanthamoebae serve as vehicles and hosts (see Gomes TS, Gjiknuri J, Magnet A, Vaccaro L, Ollero D, Izquierdo F, Fenoy S, Hurtado C, Del Águila C. The Influence of Acanthamoeba-Legionella Interaction in the Virulence of Two Different Legionella Species. Front Microbiol. 2018, 9:2962). A change of distance threshold causes the entry of the singleton into the class 1, proving their co-evolution.
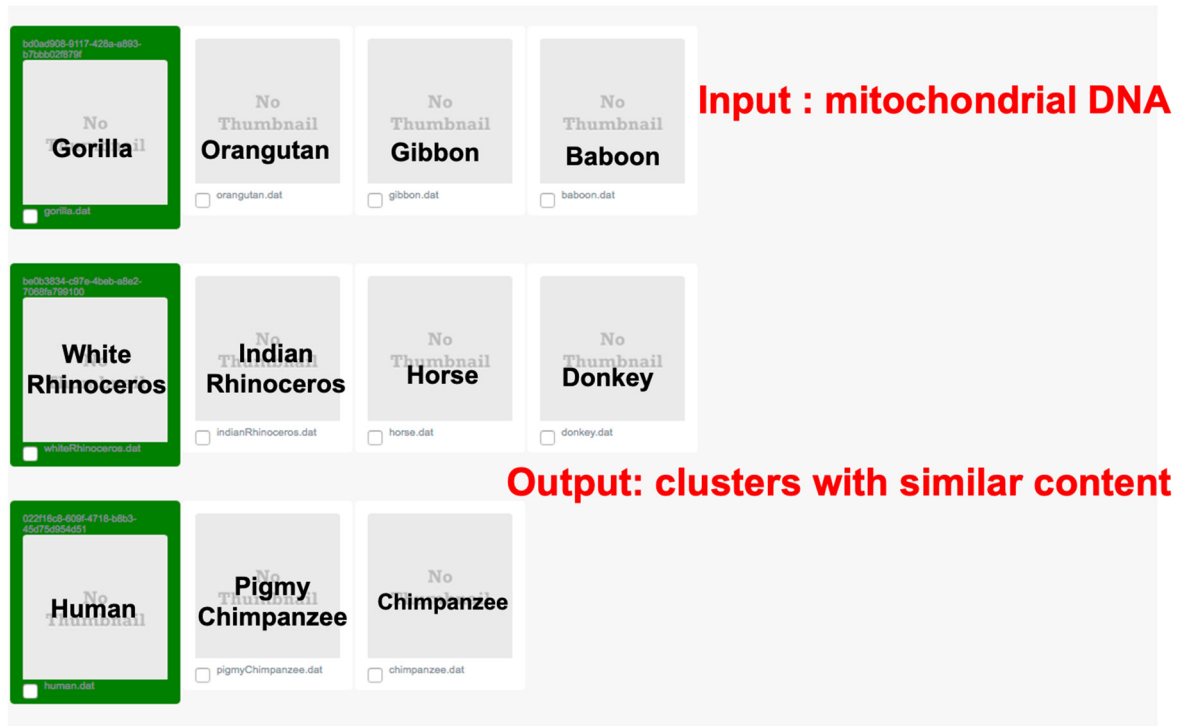

Figure S3. The classification by Maxwell of mammals from their mitochondrial DNA is coherent with the classical knowledge about their evolution.
