**Fig S1. Regional plots and R-square of linkage disequilibrium for 13 novel loci.** The blue solid line shows the recombination rate, the gray horizontal dash line indicates a significant threshold ( $p = 5e - 08$ ), and the LD score with the target variant is colored on each variant. (A) rs187199523. (B) rs140233124. (C) rs144285059. (D) rs148610742. (E) rs118180127. (F) rs117719091. (G) rs17155112. (H) rs77404202. (I) rs144225287. (J) rs150098717. (K) rs74333160. (L) rs80115676. (M) rs61404501.

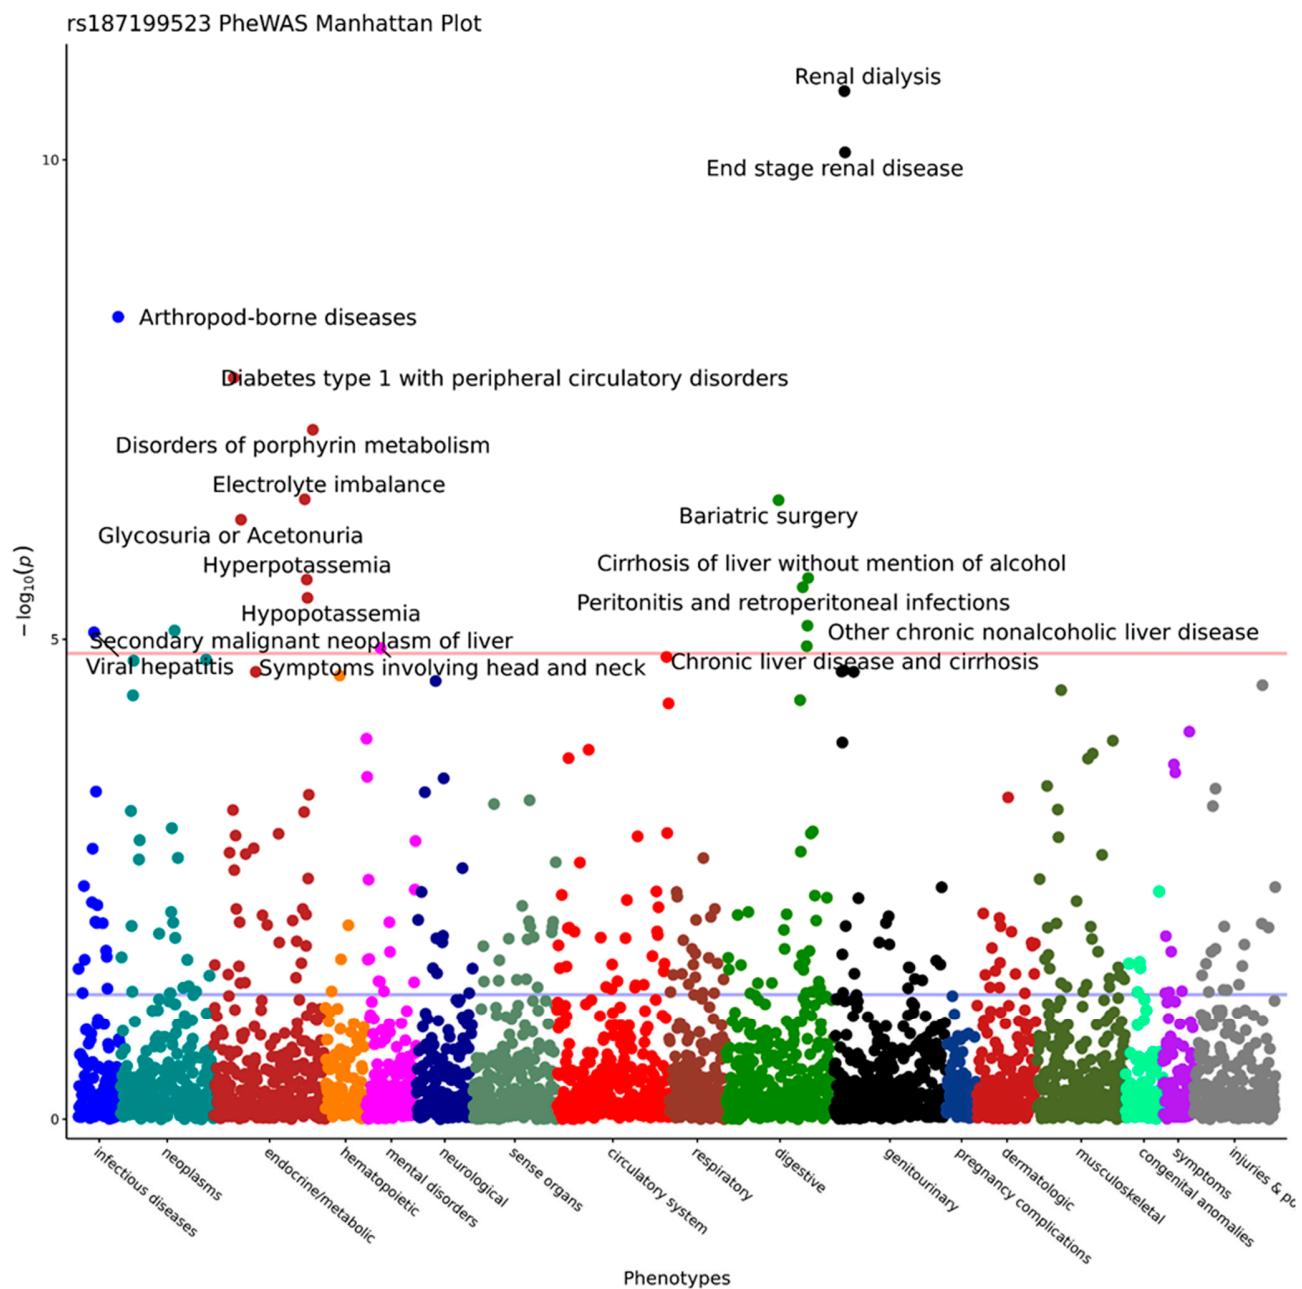

**Figure S2. Results of the GWAS for Taiwanese patients with HCC in another cohort.** Manhattan plot adjusted by sex and age and QQ-plot in another cohort in Taiwanese.

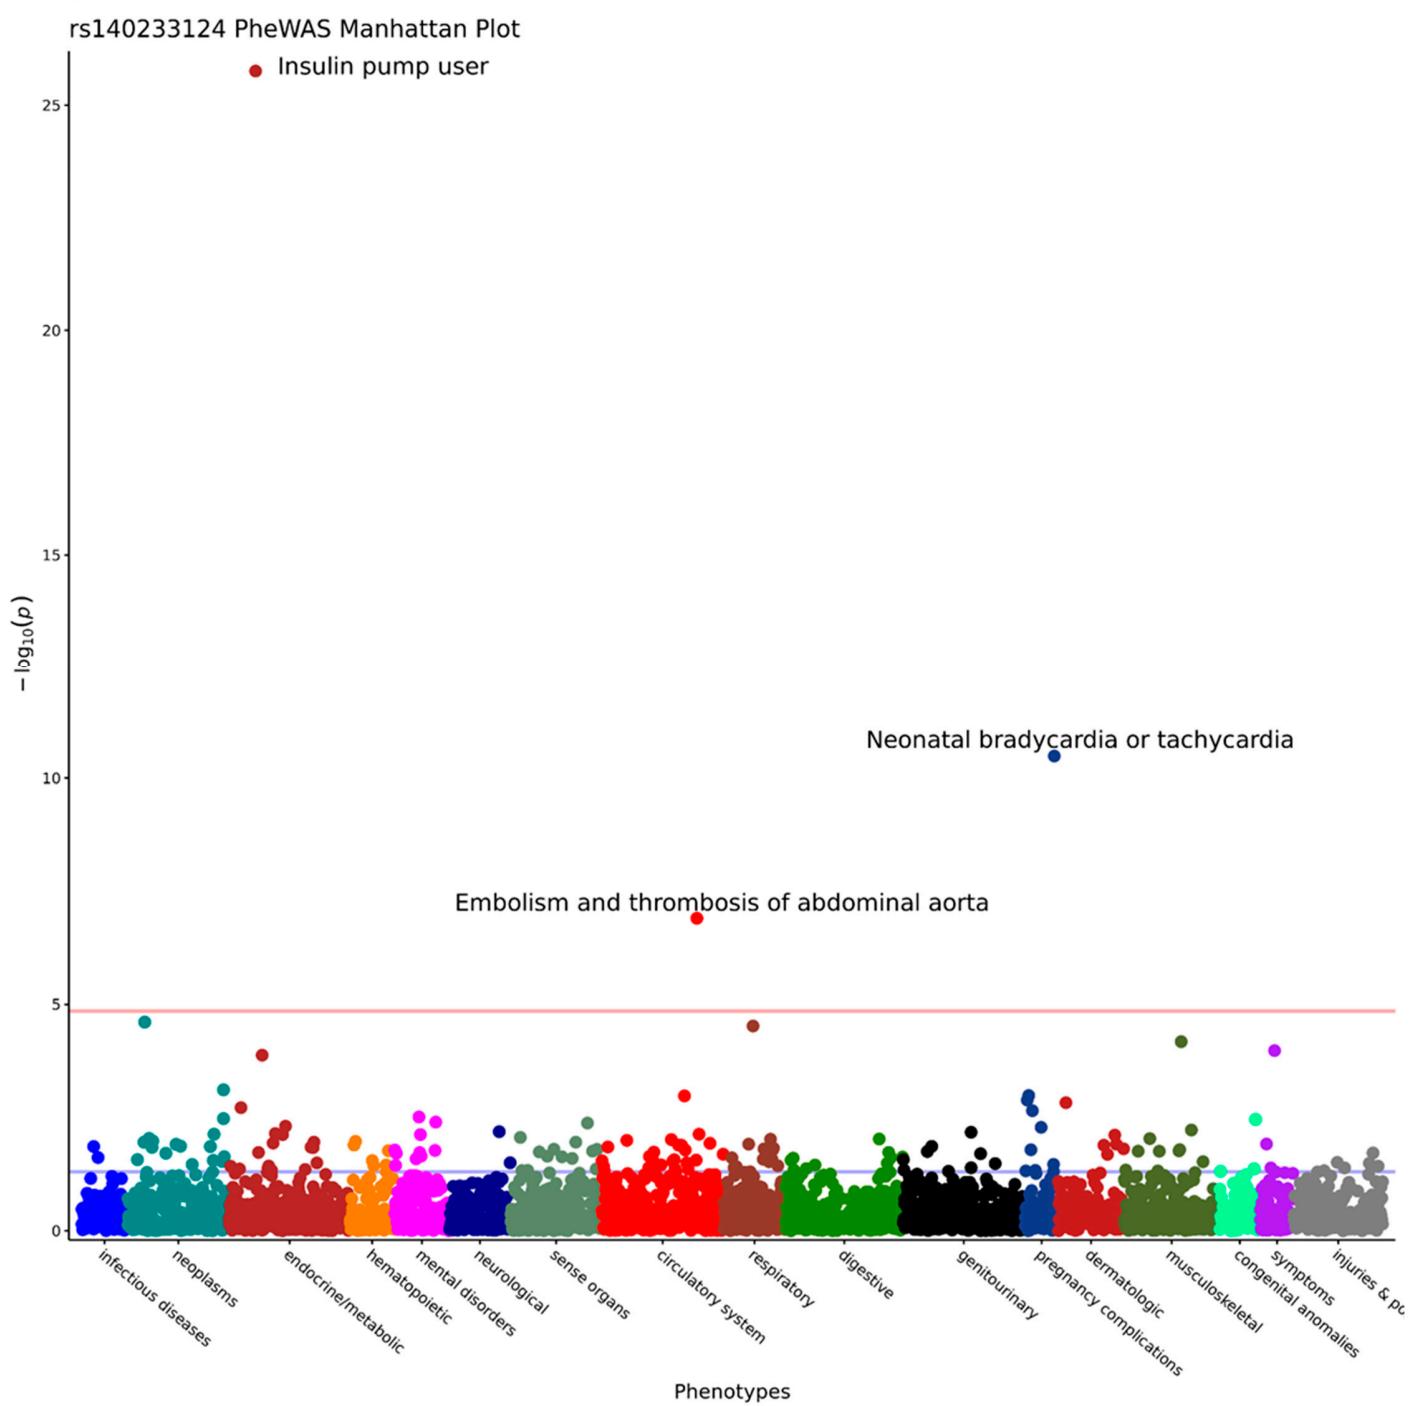

**Figure S3. PheWAS Manhattan plot for 13 novel loci in Taiwanese with HCC.** The negative log of the p-value is plotted for each of 1,791 disease phenotypes or “phecodes” in CMUH. Each color represents a disease category as defined on the x-axis. (A) rs187199523. (B) rs140233124. (C) rs144285059. (D) rs148610742. (E) rs118180127. (F) rs117719091. (G) rs17155112. ## rs6140450 PheWAS Manhattan Plot

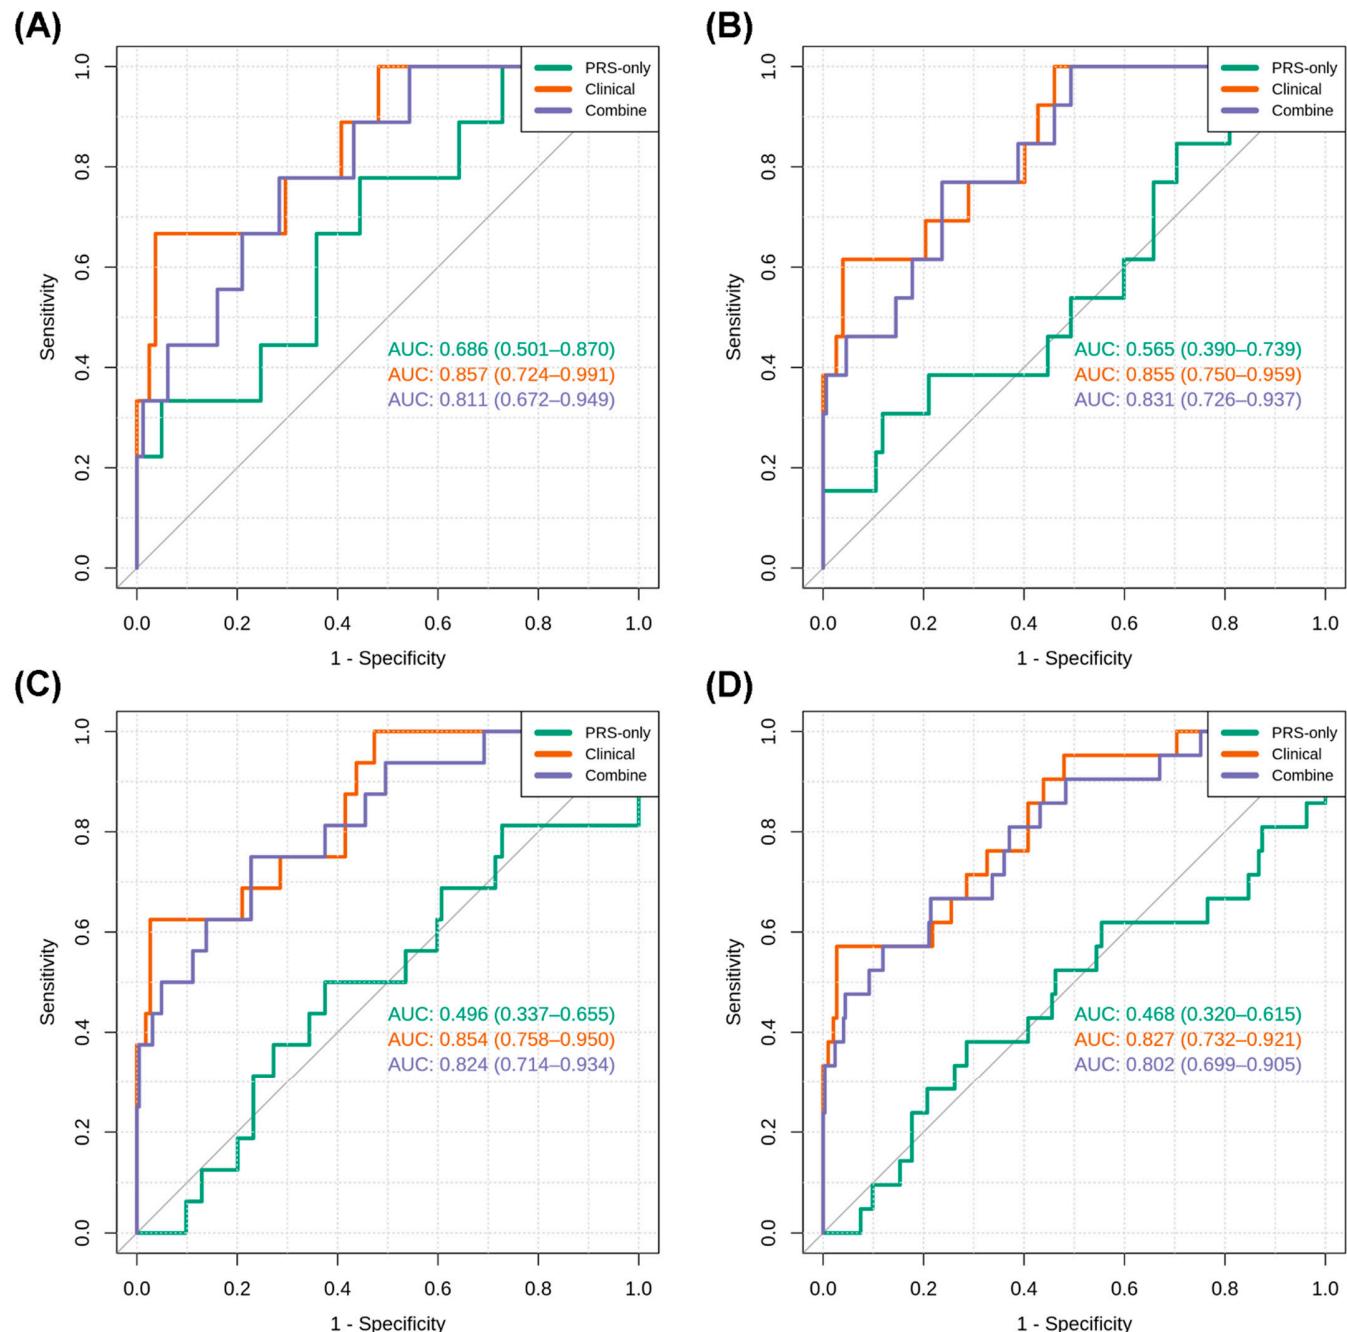

**Figure S4. Expression of five novel loci-related genes and survival in other cohorts.** The related genes that exhibited different expression in tumor and adjacent normal tissues were validated in our study by using the TCGA-LIHC dataset. The red box depicts the tumor tissue, and the green box depicts the normal tissue. Survival analysis of middle and bottom panels were conducted from TCGA-LIHC and GEO data, respectively. (A) *F11*. (B) *F11-AS1*. (C) *FRMD4A*. (D) *KIAA0232*. (E) *LINC02511*. (F) *PFKFB3*.

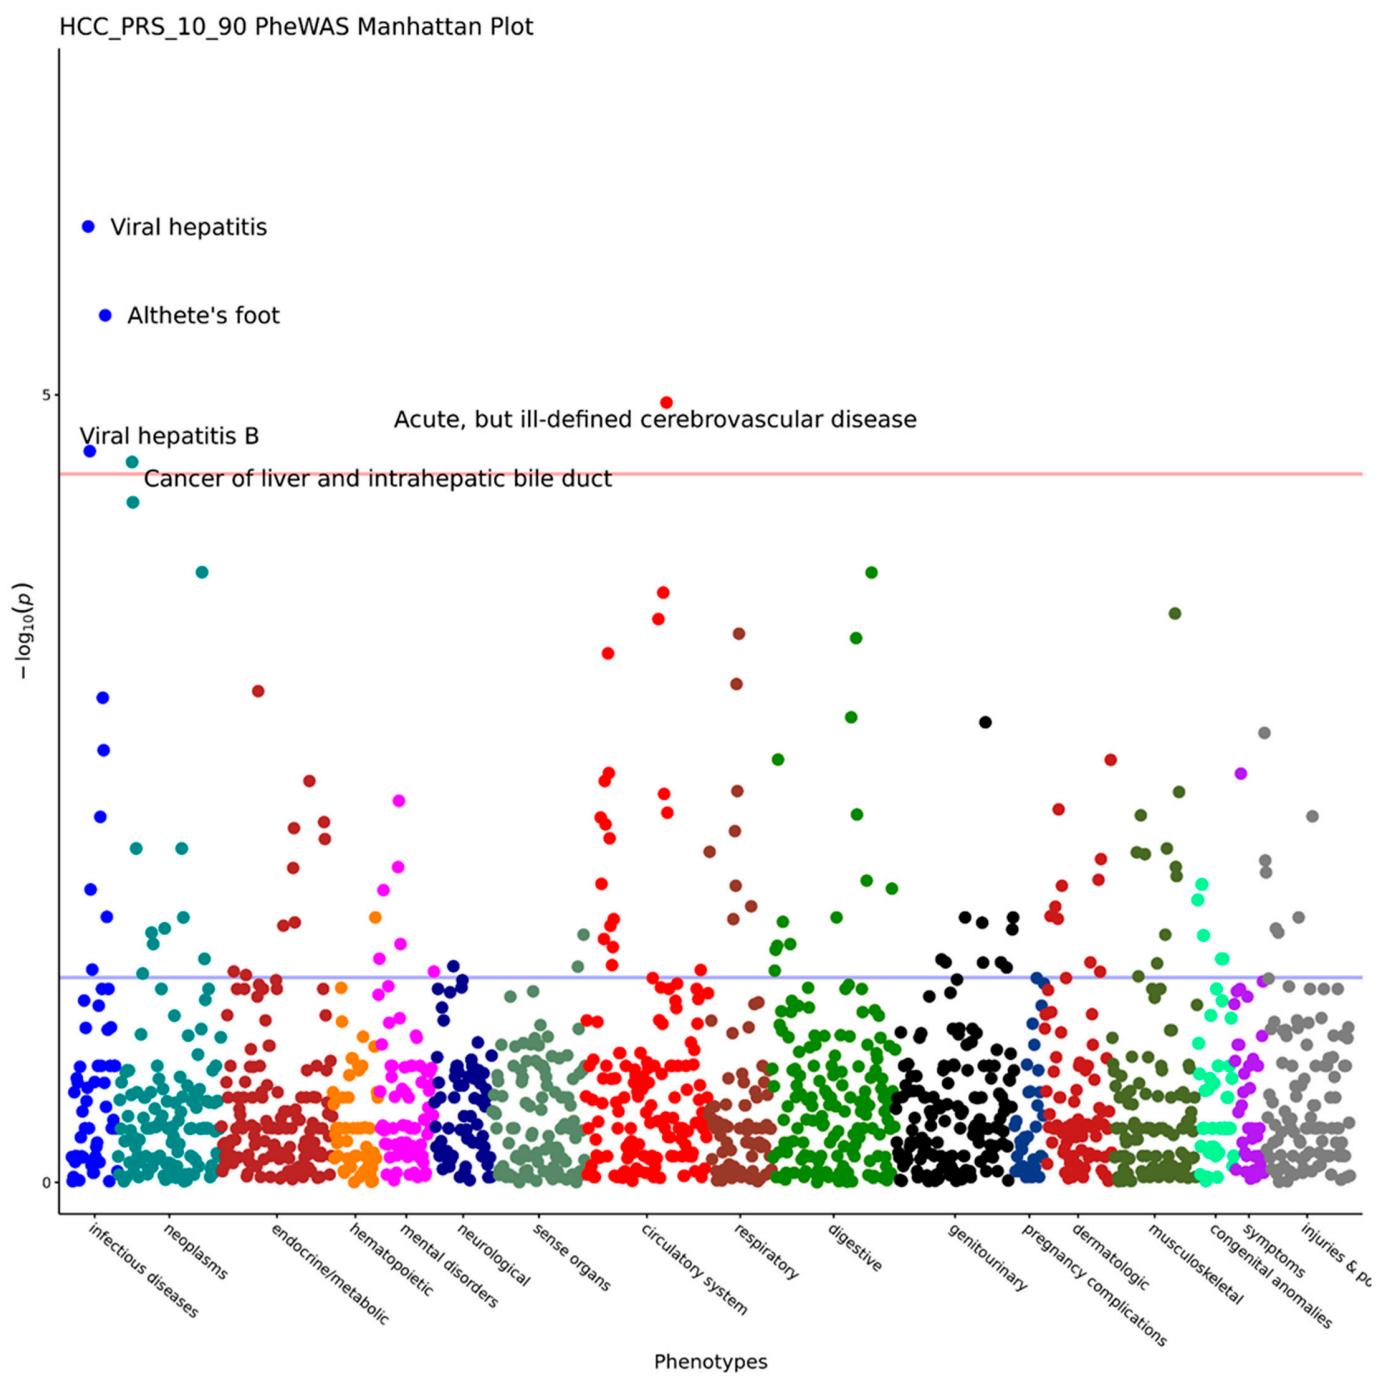

**Figure S5. Results of the analysis of the expression and somatic mutations of 13 novel loci-related genes by using the TCGA-LIHC cohort. (A) Results of the somatic mutations of 12 loci related genes. (B) Results of differential expression between HCC and noncancerous liver tissues.**

**Figure S6. Results of the performance for top 5%, 10%, 15%, and 20% PRS only, clinical data only, or combined both to predict HCC risk.** (A) ROC curve of top 5% of both extremes. (B) ROC curve of the top 10% of both extremes. (C) ROC curve of the top 15% of both extremes. (D) ROC curve of the top 20% of both extremes. Demographic factors (age, sex, and BMI) and bioclinical data (albumin, HBV surface antigen, and HCV antibody) were used in model building. Combine means both the PRS and clinical data were used in model building.

**Figure S7. PheWAS Manhattan plot for HCC PRS in Taiwanese with HCC**

**Table S1.** Variants were significant in our discovery GWAS but not in other studies, and the results of the meta-analysis by using the UK Biobank and BBJ cohort were shown. Abbreviations: Chr, chromosome; RA, reference allele; EA, effect allele; AF, allele frequency; PAF, publish allele frequency; OR, odds ratio; CI, confidence interval; MA, meta-analysis; MAF, minor allele frequency.

This table is shown in [Supplementary\\_Table\\_S1.xlsx](#)

**Table S2.** Variants were not significant in our discovery GWAS but significant after performing a meta-analysis by using data from the UK Biobank and BBJ cohort. Abbreviations: Chr, chromosome; RA, reference allele; EA, effect allele; AF, allele frequency; PAF, publish allele frequency; OR, odds ratio; CI, confidence interval; MA, meta-analysis; MAF, minor allele frequency.

The table is shown in [Supplementary\\_Table\\_S2.xlsx](#)

**Table S3.** Variants were significant in our study and other previous studies. Abbreviations: Chr, chromosome; RA, reference allele; EA, effect allele; AF, allele frequency; PAF, publish allele frequency; OR, odds ratio; CI, confidence interval; MA, meta-analysis; MAF, minor allele frequency.

The table is shown in [Supplementary\\_Table\\_S3.xlsx](#)

**Table S4. Summary statistics of 13 novel SNPs in another independent cohort in Taiwanese**

This table is shown in Supplementary\_Table\_S5.xlsx

**Table S6.1. Differential gene expression of novel loci related genes between the noncancerous and cancerous tissues of Taiwanese patients with HCC.** The 16 novel loci-related genes were retrieved; 9 genes are shown in the table below, and the other 7 genes were removed because their alignment read count was too low. Abbreviations: logFC, log fold change; logCPM, log of count per million.

**Table S8.2. Results of the performance of the PRS model in target and validate datasets.** PRS-only: PRS was used in the model only. Clinical: demographics (age, sex, and BMI) and bioclinical data (albumin, HBV, and HCV) were used in model building. Combine: PRS and clinical data both were applied for building a model. Abbreviations: AUC, area under the curve; CI, confidence interval.

<b>Dataset</b>	<b>Condition</b>	<b>Accuracy (CI)</b>	<b>AUC</b>	<b>Sensitive</b>	<b>Specificity</b>	<b>Kappa</b>
Target	PRS-only	0.555 (0.551-0.560)	0.578	0.561	0.549	0.11
	Clinical	0.771 (0.767-0.774)	0.846	0.796	0.745	0.541
	Combine	0.775 (0.771-0.779)	0.851	0.799	0.751	0.549
Validate	PRS-only	0.546 (0.520-0.571)	0.581	0.581	0.543	0.029
