Figure S1. Protein content-based EV characterization. One/two protein(s) from each category suggested by the MISEV Guidelines 2018 (Théry et al., 2018) were chosen and their presence in EV lysates checked by Western blotting: CD63 (Abcam, ab134045), CD81 (Abcam, ab109201), ALIX (Abcam ab88388), ApoA1 (Abcam, ab52945), and GM130 (Abcam, ab52945). All primary antibodies were rabbit anti-human and diluted 1:1000. Secondary antibody: Goat anti-rabbit IgG (Abcam, ab97051), dilution 1:20000. EV from all experimental conditions were positive for the characteristic EV markers CD63, CD81, and ALIX, negative for the contaminant lipoprotein ApoA1, and slightly positive for GM130.
