

Figure S1. The alignment of amino acid sequences without signal peptides of the *Pectobacterium atrosepticum* (*Pba*) Svx protein (*Pba* Svx) and *Dickeya solani* (*Dso*) Svx-like proteins (*Dso* Svx44 and *Dso* Svx45). The secondary structures predicted by AlphaFold 2 are indicated by orange horizontal cylinders (alpha helices) and blue arrows (beta-strands). Zinc-binding metallopeptidase active sites and predicted carbohydrate-binding residues are indicated by black and bright-orange frames, respectively. Amino acid residues of the *Dso* Svx44 and *Dso* Svx45 that do not correspond to the amino acid residues of the *Pba* Svx are colored gray.

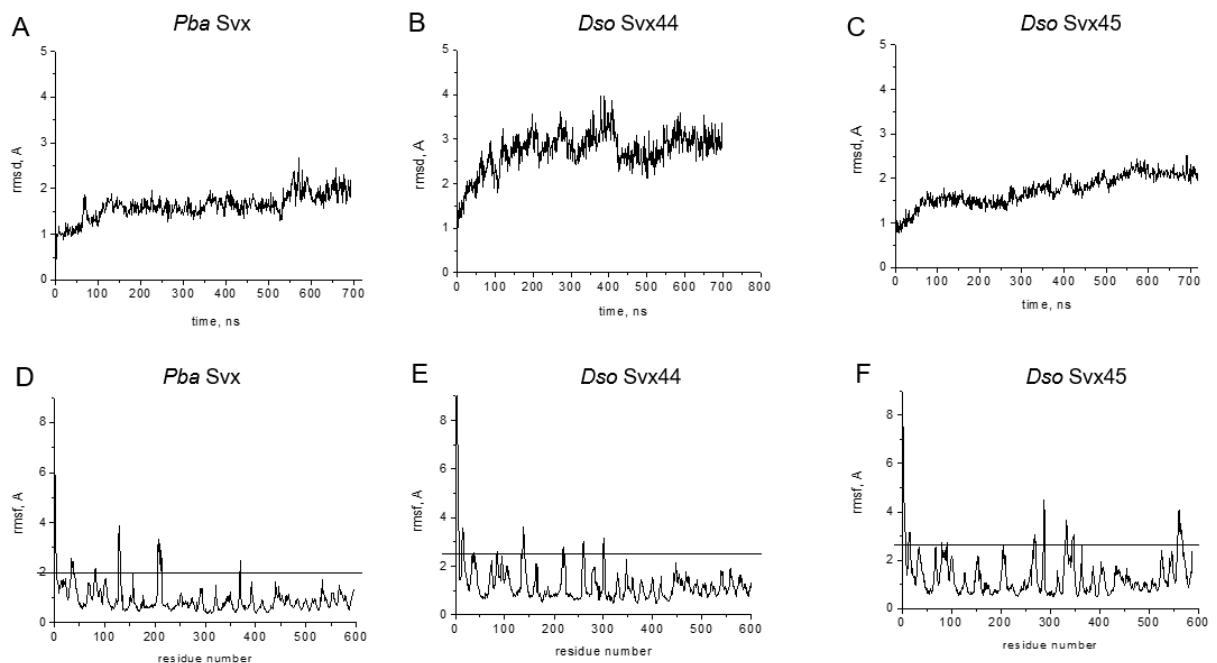

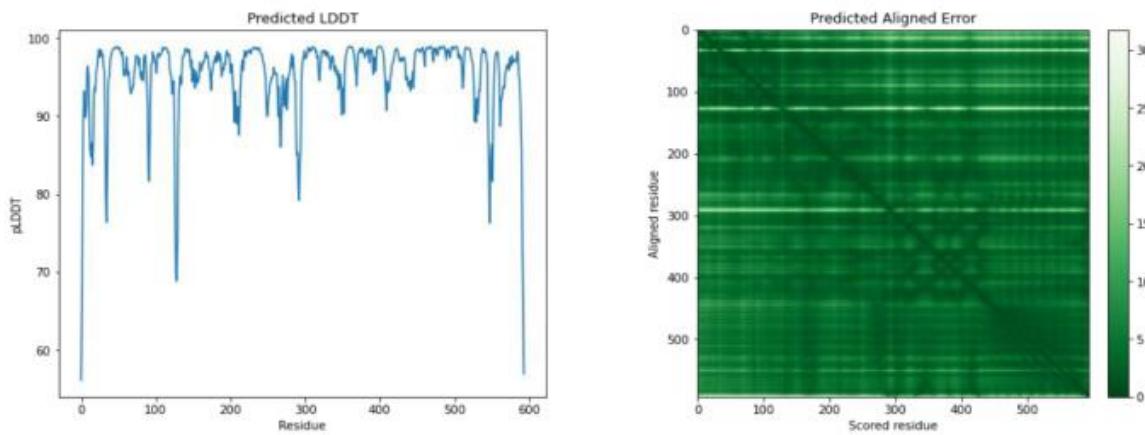

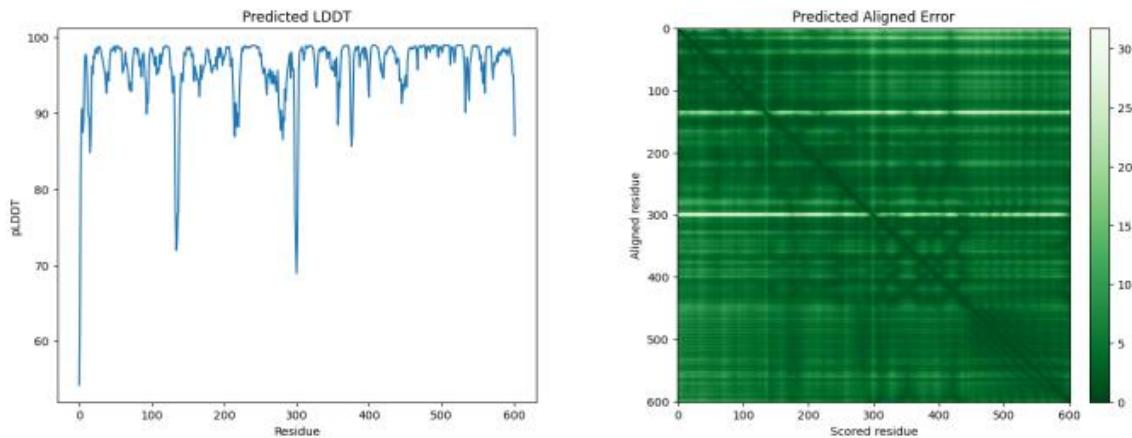

Figure S2. Root-mean square deviation (A, B, C) and root-mean square fluctuation (D, E, F) evolution over time in the course of molecular dynamics trajectories for AlphaFold 2 models of the Svx proteins of *Pectobacterium atrosepticum* (*Pba* Svx) and *Dickeya solani* (*Dso* Svx44 and *Dso* Svx45). The horizontal lines indicate a double value of the trajectory averaged rmsf value.

### A Pba Svx

### B Dso Svx44

### C Dso Svx45

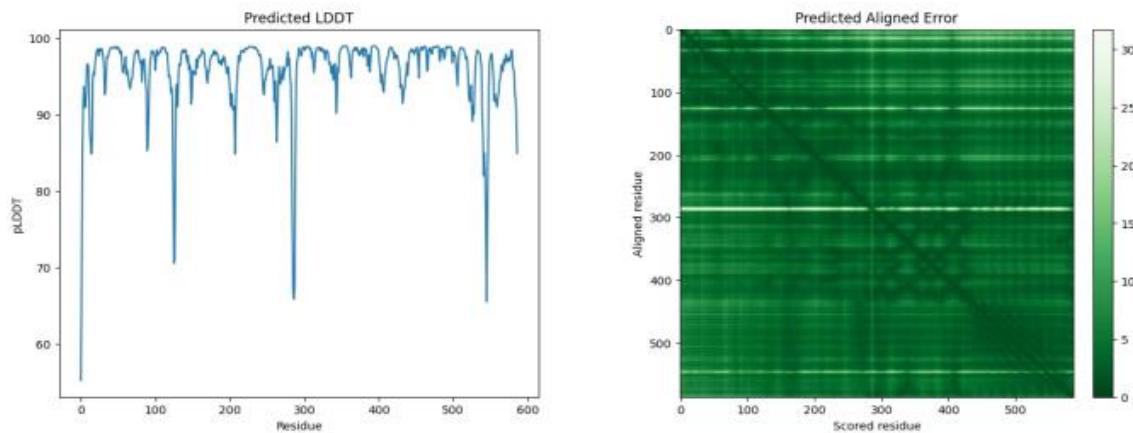

Figure S3. The results of the predicted local-distance difference test for each residue position of the models (built by AlphaFold 2) of the Svx proteins of *Pectobacterium atrosepticum* (*Pba* Svx) and *Dickeya solani* (*Dso* Svx44 and *Dso* Svx45). Data for *Pba* Svx were previously published in supplementary materials [Tendiuk *et al.*, 2022]. The model confidence is high, with LDDT above 70% for the majority of the residues. The regions of low confidence (slightly below 70%) are located on the loops.

Table S1. Residues forming contacts between the metallopeptidase and acyltransferase-like domains of the Svx proteins of *Pectobacterium atrosepticum* (*Pba* Svx) and *Dickeya solani* (*Dso* Svx44 and *Dso* Svx45). Shortest distances from a residue to the neighboring domain over time of trajectories are given with cut-off 0.3 nm.

	Residue	Distance (nm)	± Standard Deviation (nm)
