\*: activation pattern in HS sham group compared to HS-active group

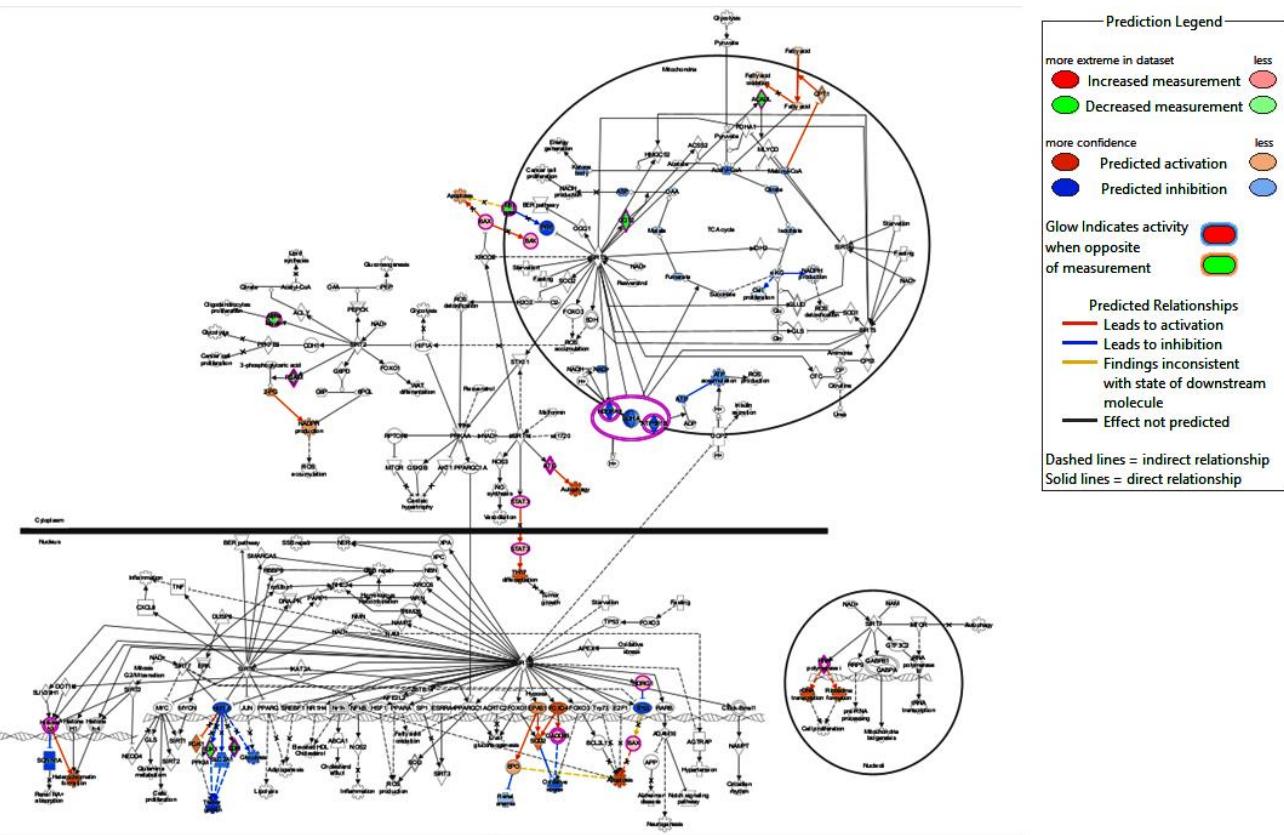

## SUPPLEMENTAL FIGURES

**Figure S1: IPA prediction of branch chain amino acid catabolism in HFpEF ( LS vs HS-sham).** Valine (A) and isoleucine (B catabolism were predicted to be inhibited.

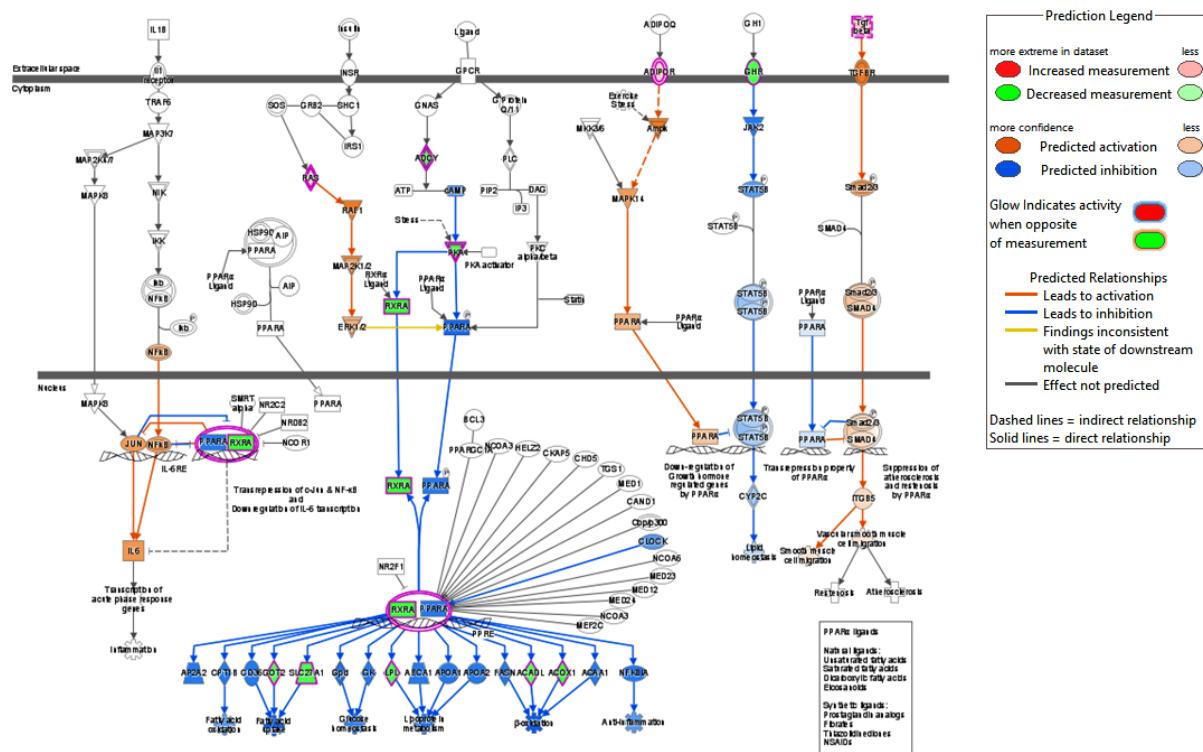

**Figure S2: IPA prediction of Tricarboxylic acid cycle in HFpEF ( LS vs HS-sham)**

**Figure S3: IPA prediction of sirtuin signaling in HFrEF ( LS vs HS-sham)**

Predicted activation of sirtuin signaling is associated with reduced fatty acid oxidation, reduced generation of acetyl CoA and TCA cycle intermediates, inhibition of mitochondrial oxidative phosphorylation, and reduced ATP generation.

**Figure S4: IPA prediction of PPAR $\alpha$ /RXR $\alpha$  signaling in HFpEF ( LS vs HS-sham)**

Predicted inhibition of PPAR $\alpha$ /RXR $\alpha$  signaling is associated with the inhibition of fatty acid oxidation and abnormal glucose homeostasis
