

Supplementary Figure S1

Expression levels of 5-hydroxymethylcytosine (5hmC) in FF-treated or non-treated 8-cell stage embryos. Presumptive zygotes (18 h post-insemination) were cultured with 0% (control) or 1% FF for 30 h, and expression levels of 5hmC in the 8-cell stage embryos (A: blastomere, B: whole embryos) were examined using immunostaining. “No.” indicates Data are presented as mean $\pm$ SEM.
