

Supplementary Figure S2. Morphology and differentiation capacity of dental tissue samples. Rep- resentative images of a) fibroblast morphology of dental tissue samples under standard culture conditions and stained with toluidine blue (bar size 100 μm) and their ability to differentiate in a specific inducing medium into b) adipocytes (bar size 200 μm), c) chondrocytes (bar size 100 μm) and d) osteoblasts (bar size 100 μm), as revealed by oily red, alcian blue and alkaline phosphatase staining, respectively. (n = 9 repetitions/source).
