

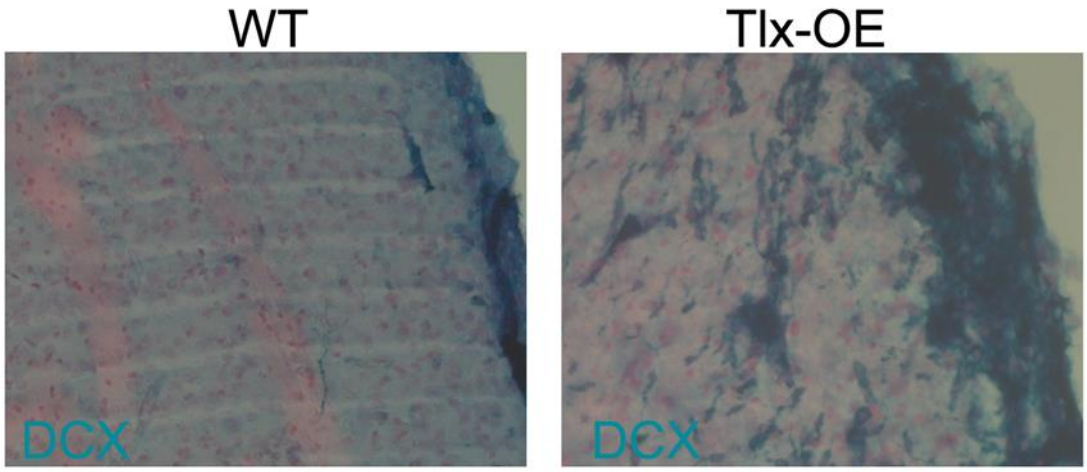

Figure S1. DCX antibody staining of brain sections from *Tlx*-OE mice 2 weeks after stroke (half hour transient MCAO). Note that only few DCX-positive cells are found in WT brain sections.

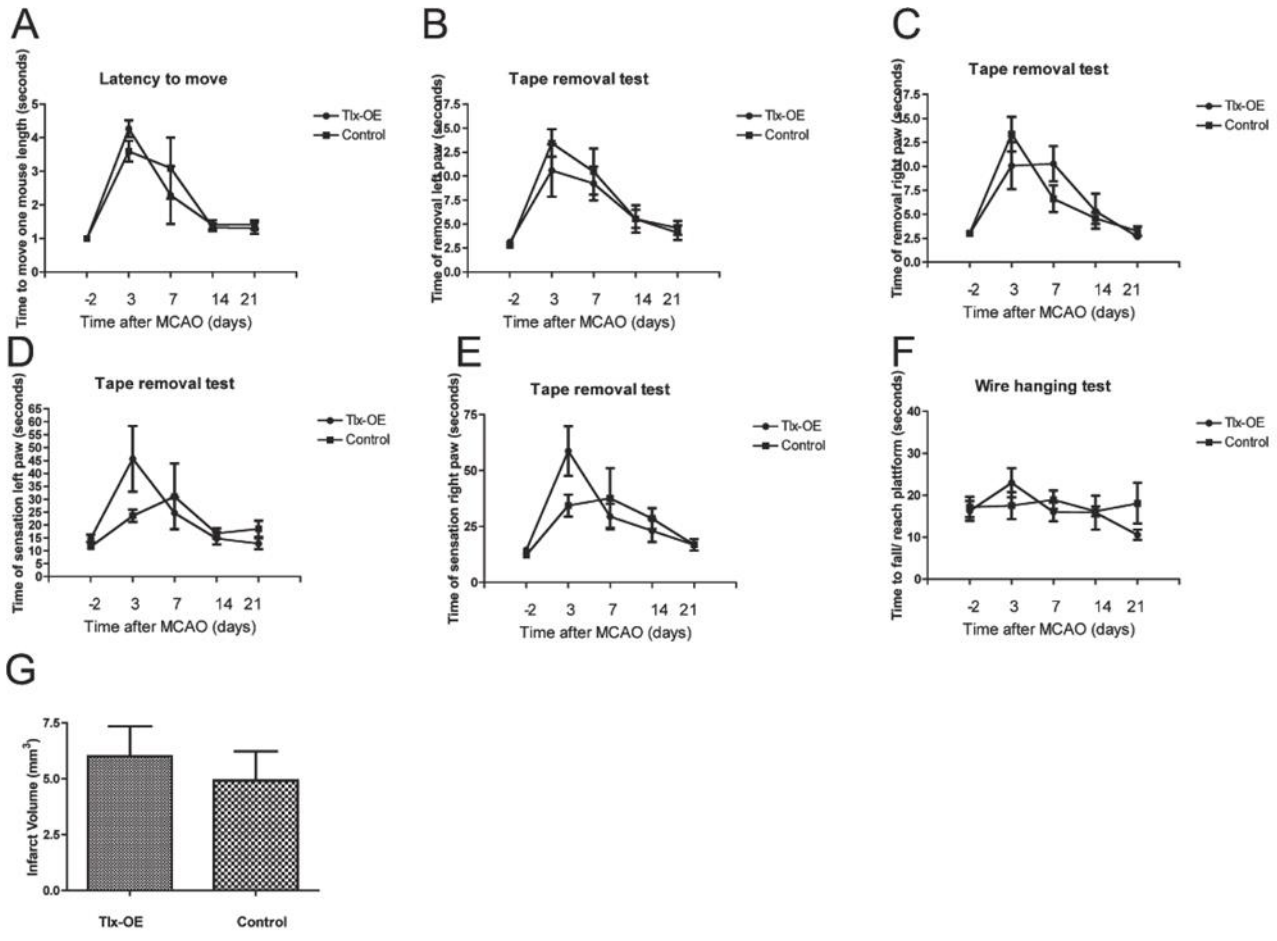

Figure S2. No significant differences were observed between Tlx-OE and control mice using a panel of behavioral tests: (A) Latency to move, (B-E) Tape removal and sensation test, (F) Wire hanging test. (G) No difference of infarct volume was observed between Tlx-OE and control mice.
