

Supplementary Figure S3 The influence of MDM2 after transfection pcDNA3.1(-)-VH- HT3 in A549.

(A) The A549 cells were transfected with pcDNA3.1(-)-VH-VH-HT3 or its negative and positive controls. The expression levels of MDM2, p53 and p-p53 was examined by the western blot assay. β-Actin was used as the indicator.

(B) The quantitative western bolt results of Mdm2 as well as p53, and p-p53 by densitometry, normalized relative to the amount of Actin.
