

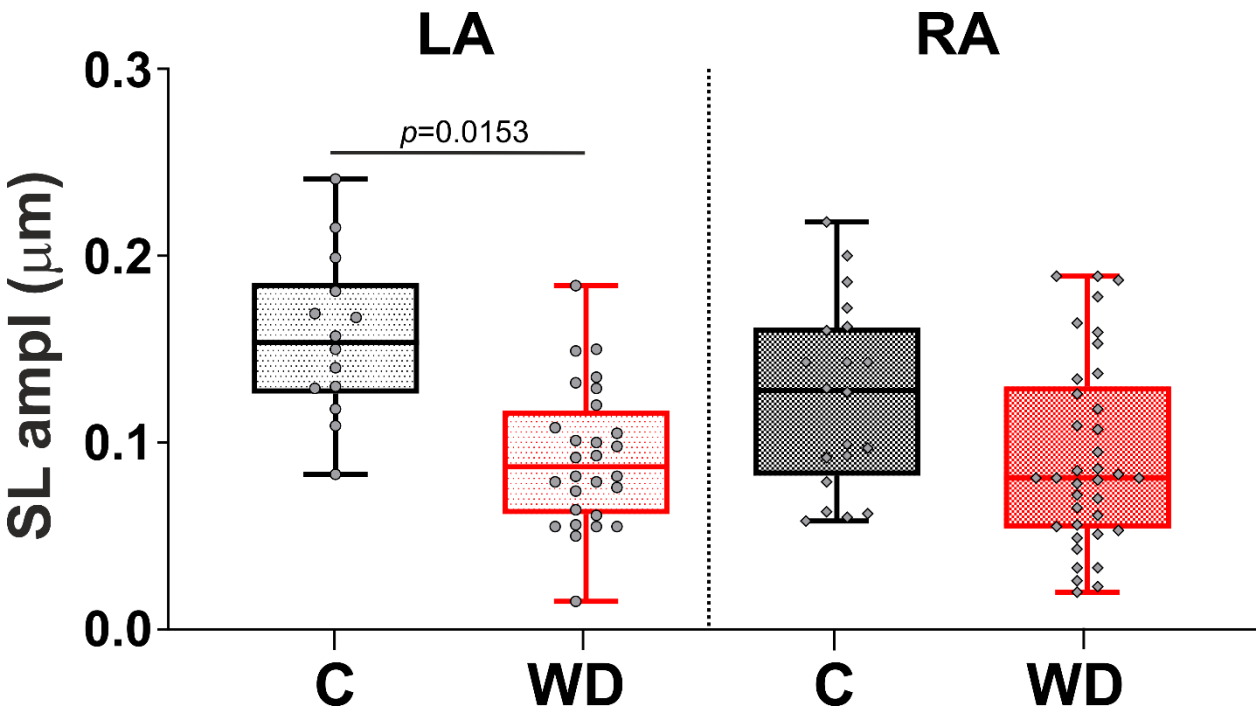

Figure S1. Effects of Western diet (WD) on absolute sarcomere length (SL) shortening amplitude (in μm, SL ampl) in atrial cardiomyocytes. LA – cardiomyocytes of the left atrium; RA – cardiomyocytes of the right atrium. Data are presented in box and whisker plots: the boxes are drawn from Q1 to Q3, bold line shows median, and whiskers provide the 100% range of the values. Each dot represents value of individual cardiomyocyte (N = 6 rats per group). Nested ANOVA followed by Sidak's post hoc test, $p < 0.05$.
