1: Average plant weight loss is calculated as (weight of control plants – weight of infested plants)//weight of control plants

2: Numbers are means ± SEM; lowercase letters indicate homogenous groups based on Tukey tests ($P > 0.05$); results indicated in bold font are significantly less affected by planthoppers than the susceptible check TN1 based on Duncan's many-to-one tests ($P > 0.05$)

3: Damage ratings are based on the standard evaluations systems (SES) for bulk tests as outlined in Table 1

4: DF = 15,80; *** = $P \leq 0.005$ ($N = 6$)

Table S2: Results from nymph Survival_{7.8n} test with 16 varieties. The Survival_{7.8n} test is a performance test that corresponds to the SSST7.8n in terms of plant age and insect densities

1: Average plant weight loss is calculated as (weight of control plants – weight of infested plants)/weight of control plants; a negative value indicates a gain in weight after exposure to insects

2: Numbers are means ± SEM; lowercase letters indicate homogenous groups based on Tukey tests ($P > 0.05$), results indicated in bold font are significantly less affected by planthoppers than the susceptible check TN1 based on Duncan's many-to-one tests ($P > 0.05$)

3: Damage ratings are based on the standard evaluations system (SES) for bulk tests as outlined in Table 1

4: DF = 15,80; *** = $P \leq 0.005$ ($N = 6$)

Table S6: Results from nymph Survival_{20.4n} test with 16 varieties. The Survival_{20.4n} test is a performance test that corresponds to the MSST_{20.4n}.

1: Plant weight loss is calculated as absolute weight loss ‘weight of control plants – weight of infested plants’ and as a proportion ‘(weight of control plants – weight of infested plants)/weight of control plants’ and yield loss as (yield of control plants – yield of infested plants)/yield of control plants.

2: Numbers are means ± SEM; lowercase letters indicate homogenous groups based on Tukey tests ($P > 0.05$); results indicated in bold font are significantly less affected by planthoppers than the susceptible check TN1 based on Duncan’s many-to-one tests ($P > 0.05$)

3: DF = 15,144 or 13,126 for yield comparisons (due to photo-period effect on grain production in Rathu Heenati and PTB33); *** = $P \leq 0.005$, ** = $P \leq 0.01$; (N = 10)

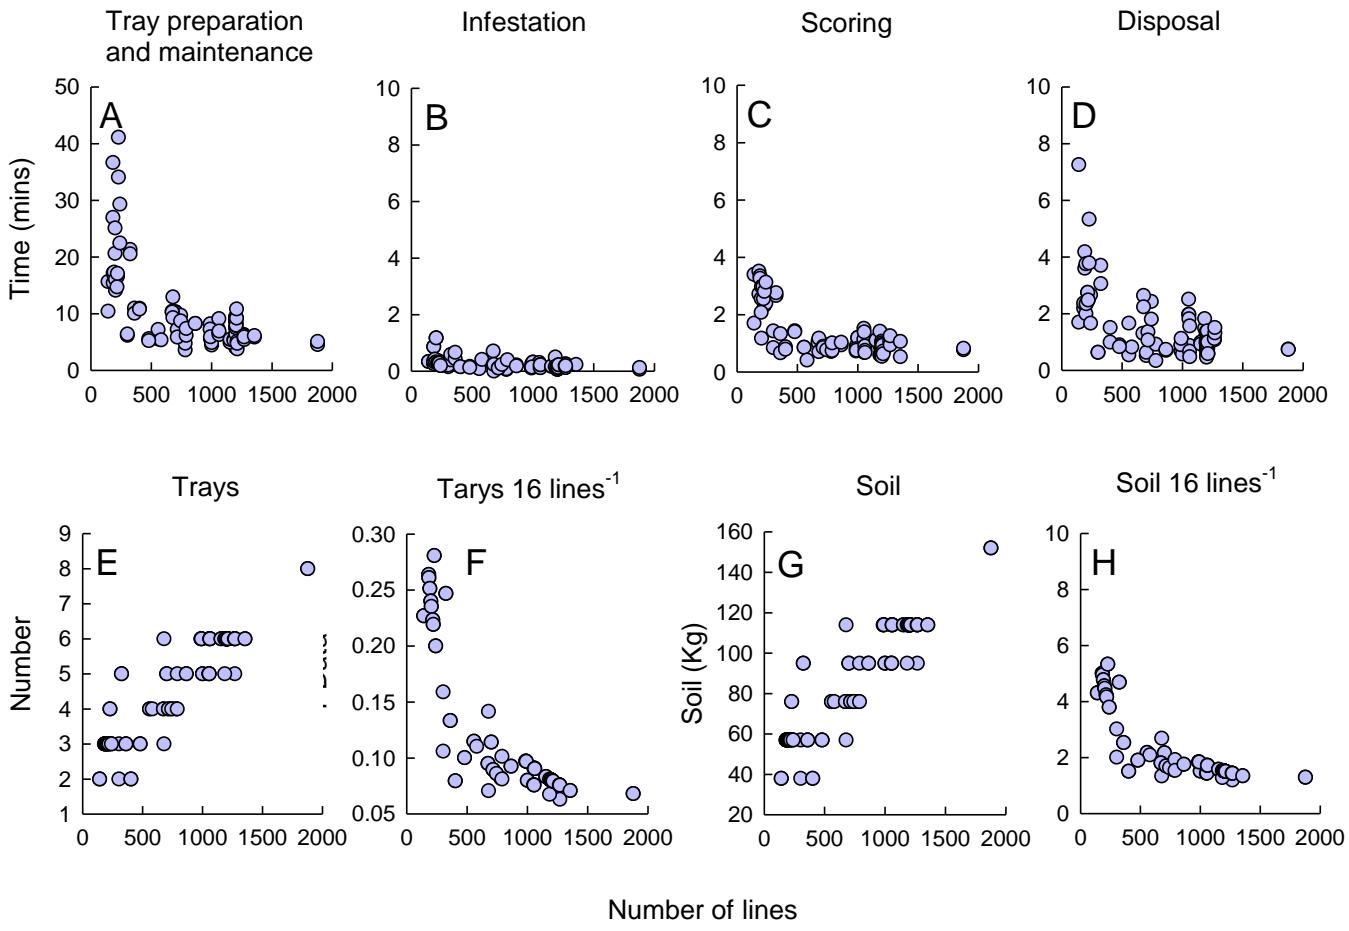

Figure S1: Time to process 16 rice lines during routine SSST with brown planthopper at IRRI. Graphs indicate the time (A) to prepare trays, (B) to infest the trays with planthoppers, (C) to score rice lines at the time that susceptible checks wilt and (D) for disposal of material after the SSST has been completed. Times are dependent on the number of lines evaluated during routine phenotyping (i.e., batch size/number of lines on x-axis). The number of trays required to test lines is indicated in (E) with the number of trays per 16 lines in (F). The amount of soil required for screening is presented in (G), with soil per 16 lines in (H).

Table S13: Estimated costs and time for processing materials during 11 phenotyping tests (see Figure 6). Details of each of the phenotyping tests are presented in Table 1
