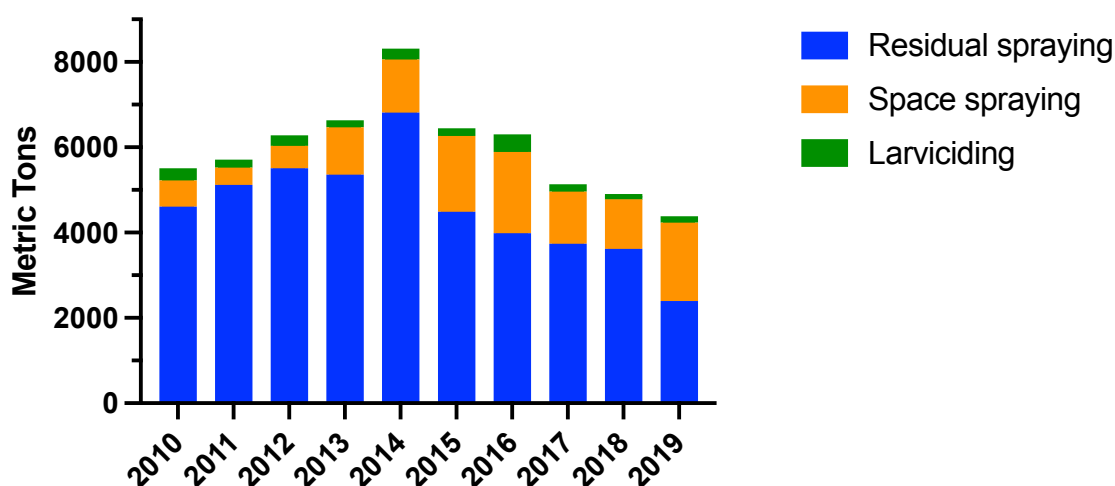

Figure S1. Global use of insecticides for vector control between 2010 and 2019, divided by the type of intervention. Adulticidal residual spraying includes organochlorines, organophosphates, carbamates, pyrethroids and neonicotinoids. Adulticidal space spraying includes organophosphates, carbamates, pyrethroids and neonicotinoids. Larviciding includes organophosphates, pyrethroids, bacterial larvicides, insect growth regulators and spinosyns. Data were extracted from Table 7 of the World Health Organization's (WHO) 2021 report titled *Global insecticide use for vector-borne disease control: a 10-year assessment (2010–2019)*, 6th edition.
