

**Supplementary Table S6.** Systematic reviews/meta-analysis on predictive validity of motor fitness tests for adverse health outcomes in adults and older adults.

Author	Type of review; number of studies (k)	Sample age	Fitness tests	Health outcomes	Main results	Conclusions
<b>Falls</b>						
Cavanaugh et al. 2018 [1]	Systematic review K = 3	≥60	Gait speed (6m) Dynamic balance (functional reach test, cm (FRT)) Timed Up&Go (TUG)	Falls	Slower gait speed (≥6s in total): RR=1.8 (1.2-2.6). FRT: $r=0.013$ , $p>0.05$ . TUG: $r=0.143$ , $p>0.05$ .	Slower gait speed identified falls. Neither the FRT nor TUG test and falls risk were significant.
Van Kan et al. 2009 [2]	Systematic review K = 4	≥65	Gait speed (5m, 6m and 10m)	Falls	Slower gait speed (<0.67m/s): RR ranging from 0.2 to 5.4 (0.1-14.3).	Slow gait speed was an independent predictor of falls.
<b>Cognitive decline and impairment</b>						
Quan et al. 2017 [3]	Meta-analysis K = 17	≥60	Gait speed (2.4m, 3m, 4m, 4.9m, 6m, 7m, 8m, 9m, 10m, 60m and 400m)	Cognitive decline and dementia	Slower gait speed: RR=1.9 (1.5–2.3), for cognitive decline. Slower gait speed: RR=1.7 (1.4–1.9), for dementia.	Slow or decreased gait speed predicted elevated risk of cognitive decline and dementia.

					Every 1 m/s decrement in gait speed: RR=1.1 (1.1–1.2), for dementia.	
Van Kan et al. 2009 [2]	Systematic review K = 7	≥65	Gait speed (2.4m, 4m, 4.6m, 5m and 6m)	Cognitive decline	Slower gait speed (<1m/s): RR ranging from 0.4 to 5.6 (0.2-12.6).	Gait speed at usual pace predicted cognitive impairment.
Grande et al. 2019 [4]	Systematic review K = 39	62-93	Gait speed (2.4m, 3m, 4m, 4.5m, 4.8m, 5m, 5.6m, 6m, 7m, 7.6m, 9m, 15m, 40m)	Cognitive decline and/or dementia	Slower gait speed (<0.8m/s): RR ranging from 1.1 to 5.0 (0.53-48.2).	Slow or decreased gait speed predicted elevated risk of cognitive decline and/or dementia.
Peel et al. 2019 [5]	Systematic review K = 36 Meta-analysis K = 27	≥60	Gait speed (2.4m, 3.7m, 4m, 4.6m, 5m, 5.3m, 5.6m, 6m, 7m, 7.6m, 7.9m, 8m, 10m, 20m, 30m)	Cognitive decline and dementia	Parameter estimate=-0.1 (-0.1, -0.1) m/s, <i>p</i> <0.001, for cognitive decline. Parameter estimate=-0.2 (-0.2, -0.2) m/s, <i>p</i> <0.001, for mild dementia. Parameter estimate=-0.4 (-0.5, -0.3) m/s, <i>p</i> <0.001, for moderate dementia.	Slow or decreased gait speed predicted elevated risk of cognitive decline and dementia.
<b>Mobility limitations and disability</b>						
Cavanaugh et al. 2018 [1]	Systematic review K = 6	≥60		Disability in instrumental daily activities	Usual gait speed (<1m/s): HR=1.5 (1.3-1.7), for persistent mobility disability; and: HR=1.5 (1.2-	Slower gait speed was a predictor

	<p>Gait speed (2.4m, 4m, 6m and 15.24m)</p> <p>Postural balance (semi-tandem stance, tandem stance one-leg stance, 30s/test (0-90s); side-by-side, semi-tandem stance, tandem stance, 10s/test)</p> <p>TUG</p>	<p>(IADL); mobility limitations</p>	<p>1.8), for persistent severe mobility disability.</p> <p>Slower gait speed, 2.4m (<math>\geq 9</math>s in total): OR=3.4 (1.8–6.5); 6-8s: OR=2.6 (1.4–4.9); 4-5s: OR=2.1 (1.2–4.0), for mobility limitations.</p> <p>Fastest gait speed: OR=7.9, <math>p=0.04</math>, for mobility limitations.</p> <p>Gait speed, 2.4m (<math>\geq 9</math>s in total): OR=5.4 (1.2–23.6), for IADL.</p> <p>Gait speed, 4m (<math>&lt; 0.6</math>m/s): 12 months, OR=0.5 (0.02-16.00); 18 months, OR=0.2 (0.01-8.79), for IADL.</p> <p>Total balance test (<math>&lt; 53</math>s): HR=1.6 (1.4-1.8), for persistent mobility disability; and HR=1.85 (1.6-2.2), for persistent severe mobility disability.</p> <p>Tandem stance (<math>&gt; 2</math>-<math>&lt; 10</math>s): OR=1.6 (1.1-2.6), for mobility disability.</p>	<p>of disability in IADL and mobility limitations.</p> <p>Balance tests identified preclinical disability due to disability in IADL and mobility disability.</p> <p>The tug test did not identify preclinical disability in mobility and IADL.</p>
--	--	-------------------------------------	--	--

Van Kan et al. 2009 [2]	Systematic review K = 10	≥65	Gait speed (2.4m, 4m, 4.6m, 4.9m, 6m, 11m and 400m)	IADL; mobility limitations	Tandem stance (>2-<10s): OR=2.5 (1.2-4.8), for IADL.  TUG: OR=1.1, <i>p</i> =0.24, for mobility disability.  Slower gait speed (<1m/s): RR ranging from 0.7 to 6.1 (0.5-23.6), for IADL.  Slower gait speed (<1m/s): RR ranging from 0.6 to 2.1 (0.9-6.5), for mobility limitations.	Slow gait speed was found to predict disability in IADL and mobility limitations.
Wang et al. 2020 [6]	Systematic review K = 62 Meta-analysis K = 45	54-86	Gait speed ( <i>unreported distances</i> ) Postural balance (Berg Balance Scale, one-leg stance (5s), side-by-side, semi-tandem stance, tandem stance) TUG	IADL	Slower gait speed (<1m/s): OR=4.4 (1.3–14.5).  One-leg balance stance (<5s): OR=2.7 (1.3–5.7).  Worse TUG performance (>12s): OR=3.4 (1.9–6.3).	Worse physical performance in gait speed, one-leg balance or TUG predicted IADL.
<b>Hospitalization/ institutionalisation</b>						
Cavanaugh et al. 2018 [1]	Systematic review K = 2	≥60	Gait speed (6m) Postural balance ((semi-tandem stance, tandem	Hospitalization	Slower gait speed (<1m/s): HR=1.3 (1.0–1.6).	Slow gait speed and impairment balance identified hospitalization.

Van Kan et al. 2009 [2]	Systematic review K = 5	≥65	stance one-leg stance, 30s/test (0-90s)  Gait speed (4m, 4.9m, 6m, 10m)	Institutionalisatio n or hospitalization	Total balance (<53s): HR=1.4 (1.1-1.7).  Slower gait speed (<1m/s): RR ranging from 1.0 to 5.9 (1.0-18.5).	Slow gait speed was found to predict institutionalisation or hospitalization.
<b>Mortality</b>						
Van Kan et al. 2009 [2]	Systematic review K = 9	≥65	Gait speed (2.4m, 4m, 4.6m, 4.9m and 6m)	All-cause mortality	Slower gait speed (<1m/s): RR ranging from 0.7 to 7.4 (0.5-14.5).	Slow gait speed was found to predict mortality.

B, non-standardized regression coefficient; FRT, Functional Reach Test; HR, Hazard Ratio; IADL, Disability in Instrumental Activities of Daily Living; OR, Odd Ratio; RR, relative risk; TUG, Timed Up&Go test.
