

Section S1.

1. Reliability and MDC values

Sample: 10 male participants

	Walk		Run	
	ICC	MDC	ICC	MDC
Peak medial tibiofemoral force (BW)	0.951	0.27	0.901	0.61
Peak medial tibiofemoral stress (MPa)	0.947	0.01	0.899	0.02
Peak medial tibiofemoral strain	0.945	0.16	0.898	0.35

Table S1: Reliability and MDC values for running and walking.

	Mean	SD
Peak medial tibiofemoral force walking (BW)	3.25	0.55
Peak medial tibiofemoral force running (BW)	8.11	1.09

Note: $MDC = 1.96 \times SEM \times \text{square root of } 2$.

Section S2.

1. Sensitivity analysis

Sample: N = 10 male participants

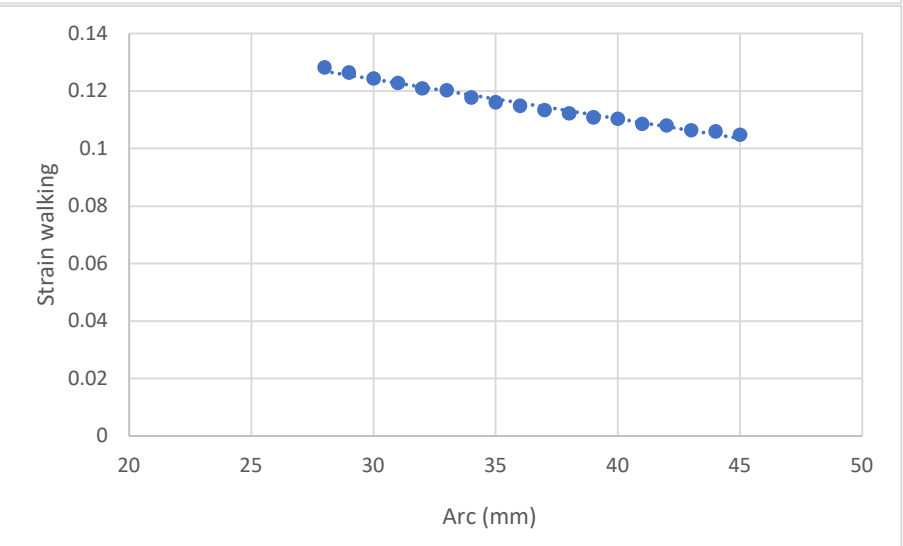

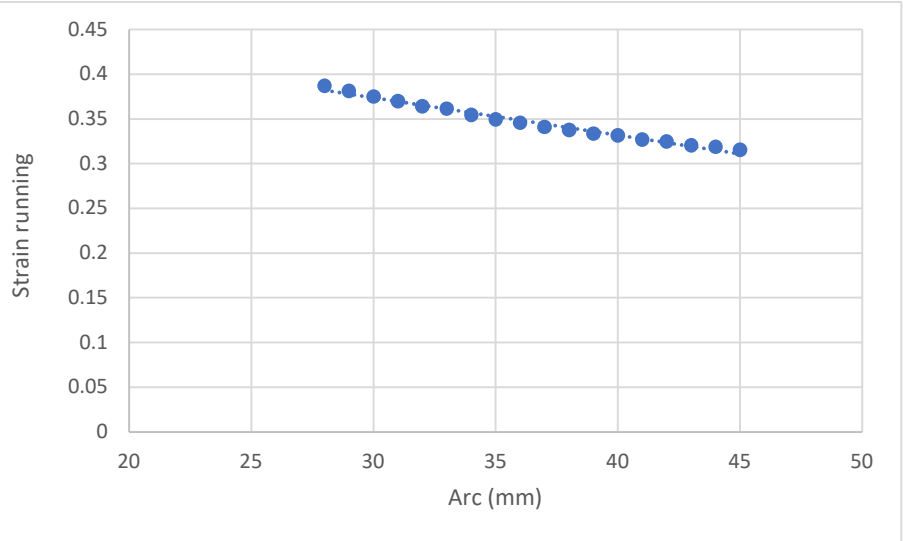

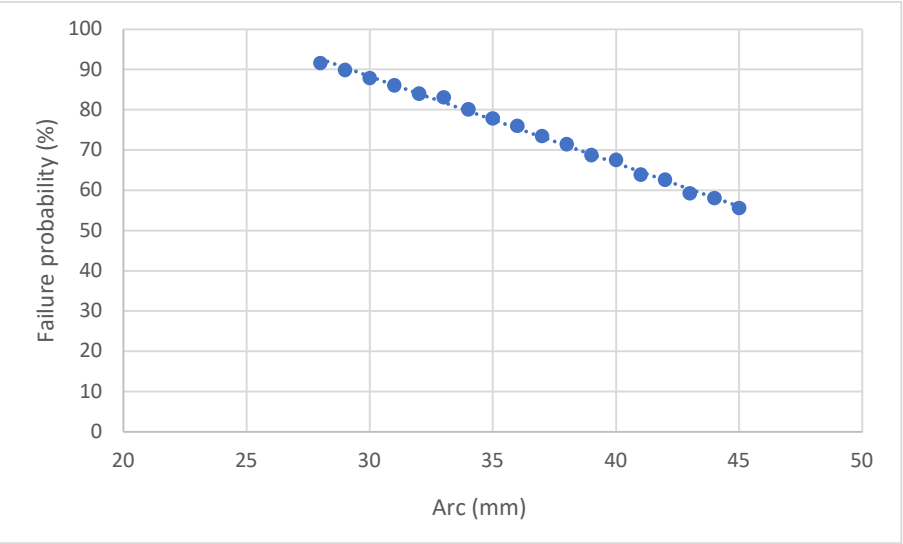

Table S2: Walking and running velocities

	Mean	SD
Walking Velocity (m/s)	1.62	0.21
Running velocity (m/s)	4.11	0.44

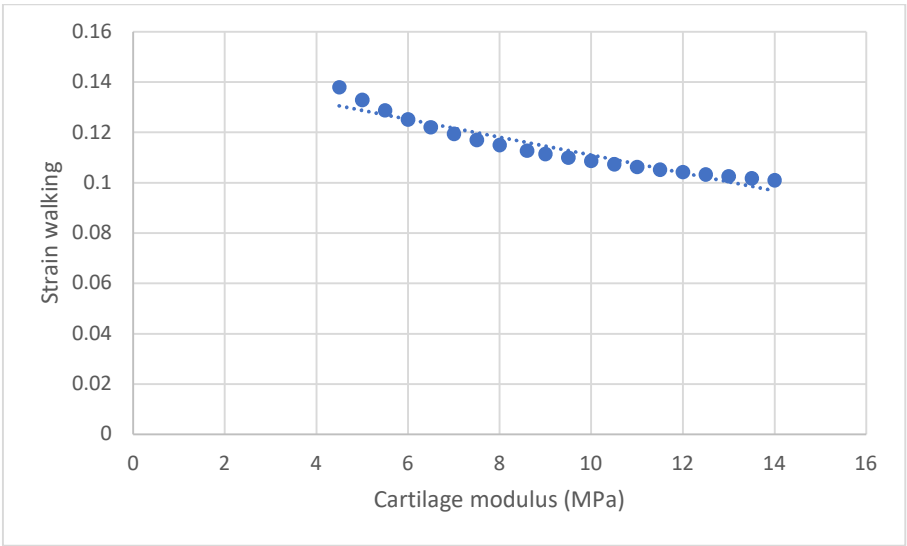

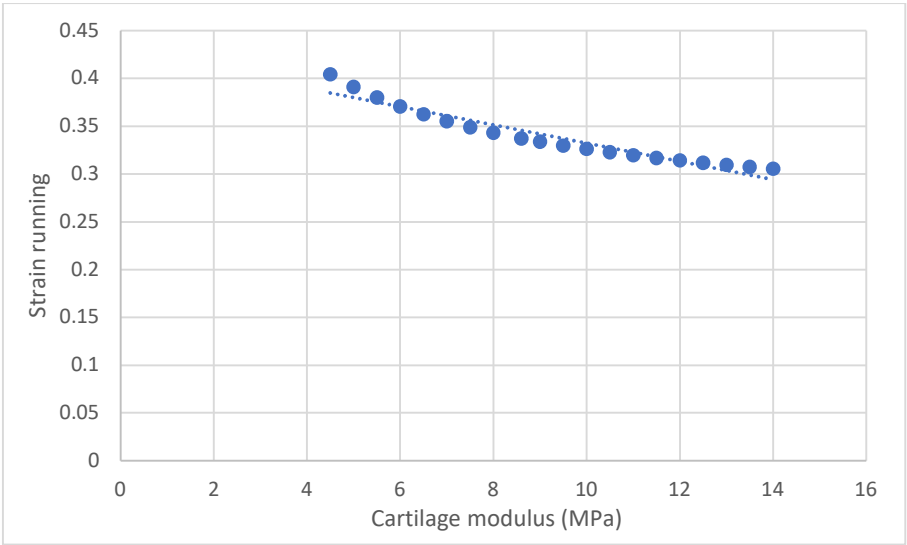

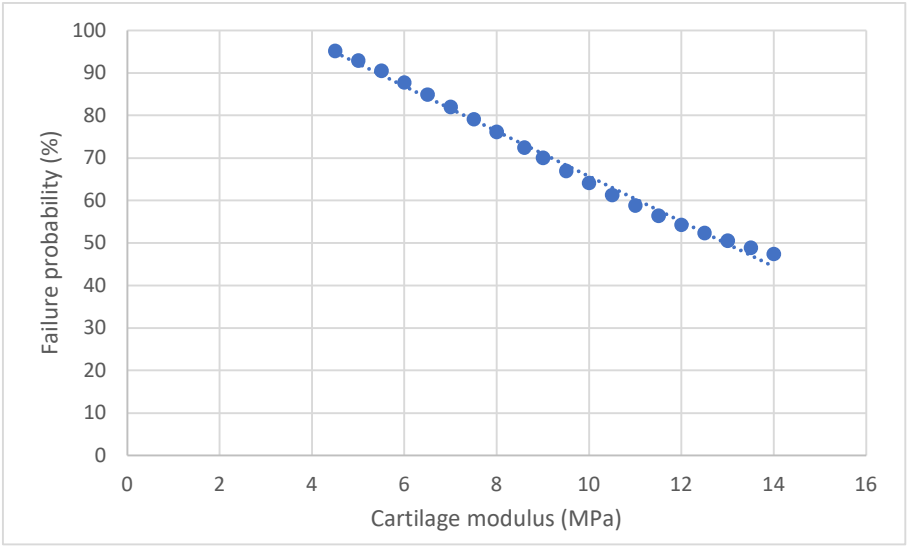

Table S2: Input peak medial tibiofemoral forces during walking and running

Sensitivity analyses – linear line of best fit included to highlight the nature of the data distribution.

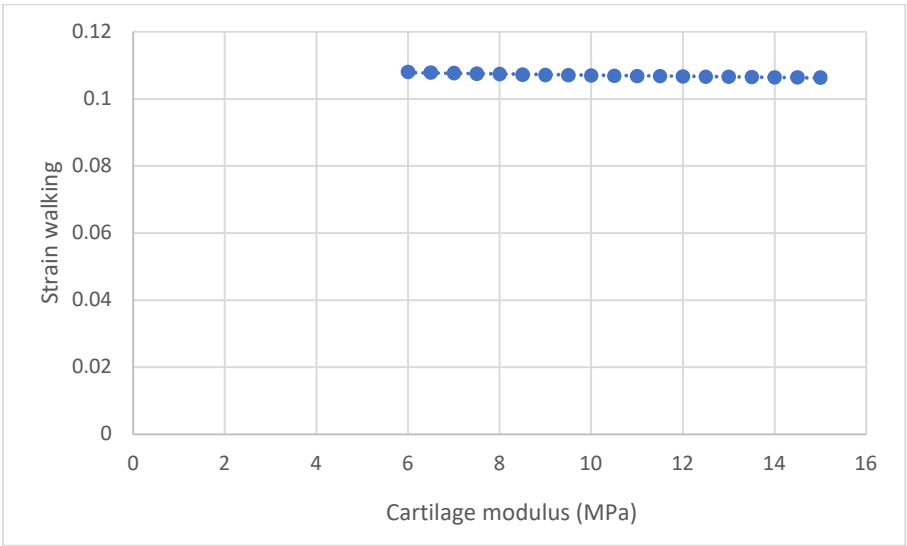

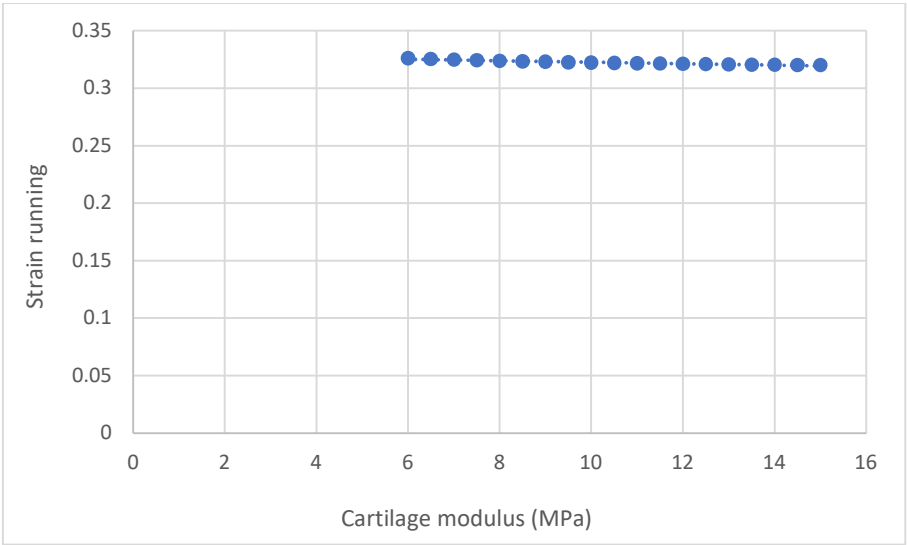

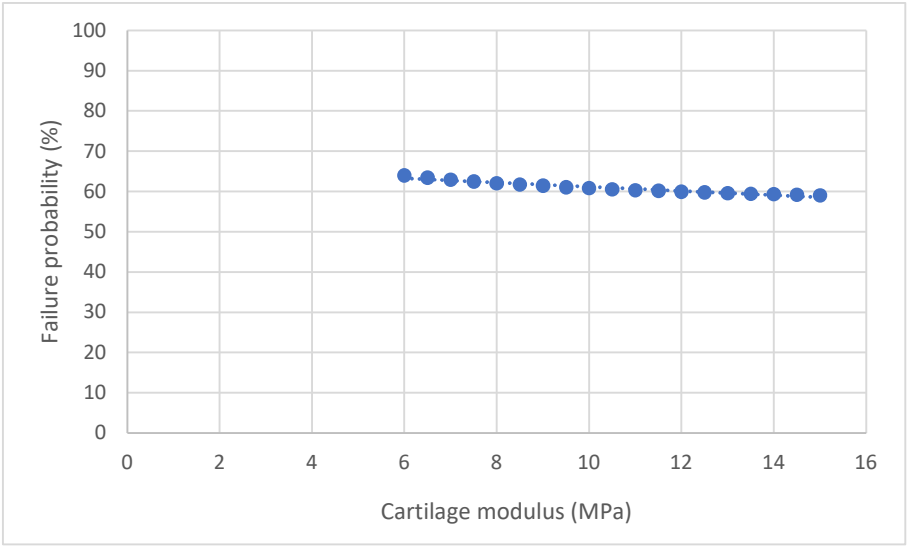

Anterior femoral arc in sagittal plane

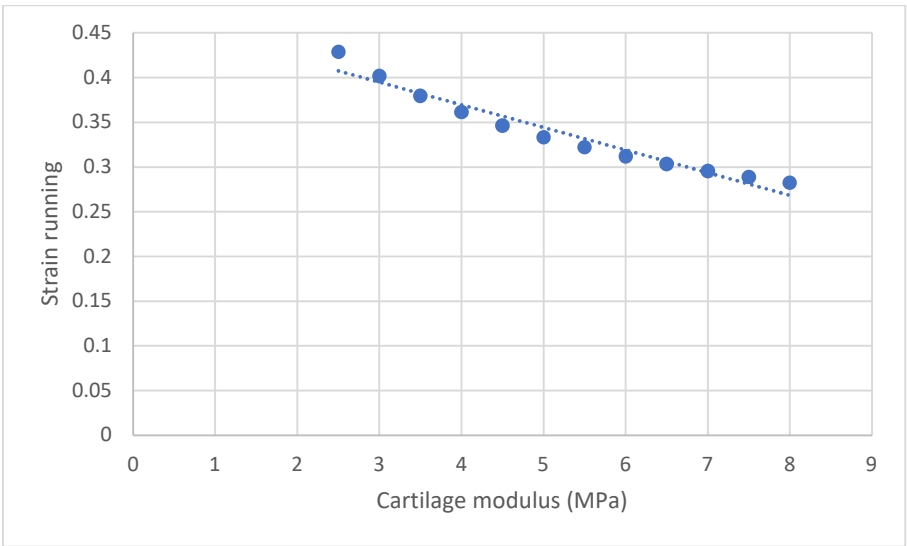

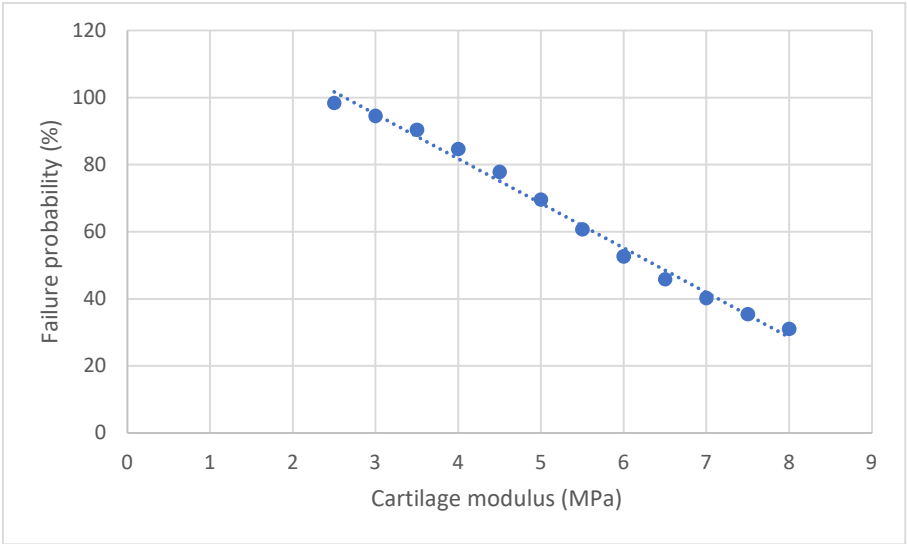

Femoral cartilage modulus

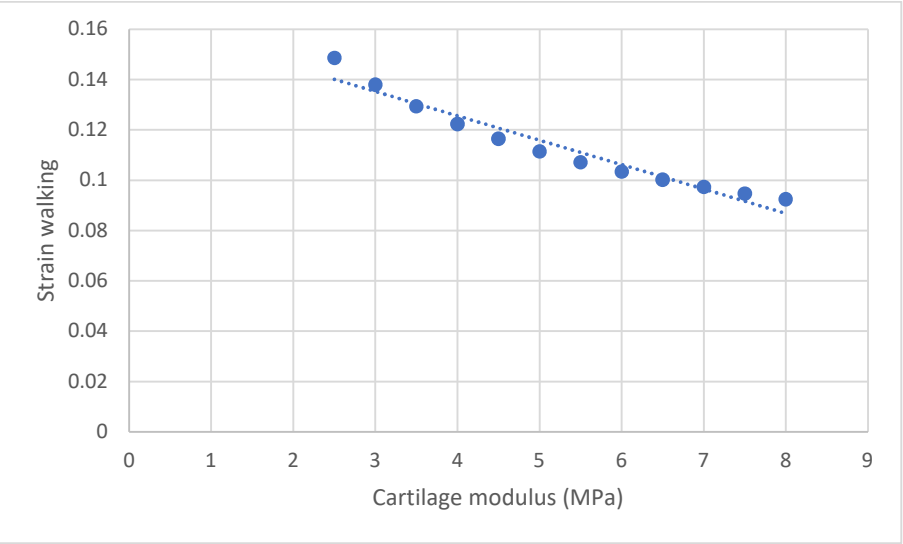

Covered tibial cartilage modulus

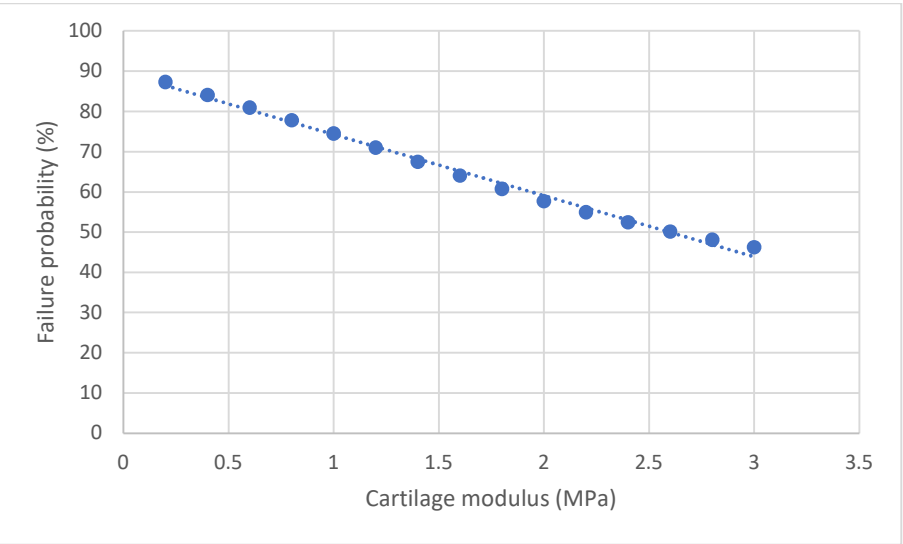

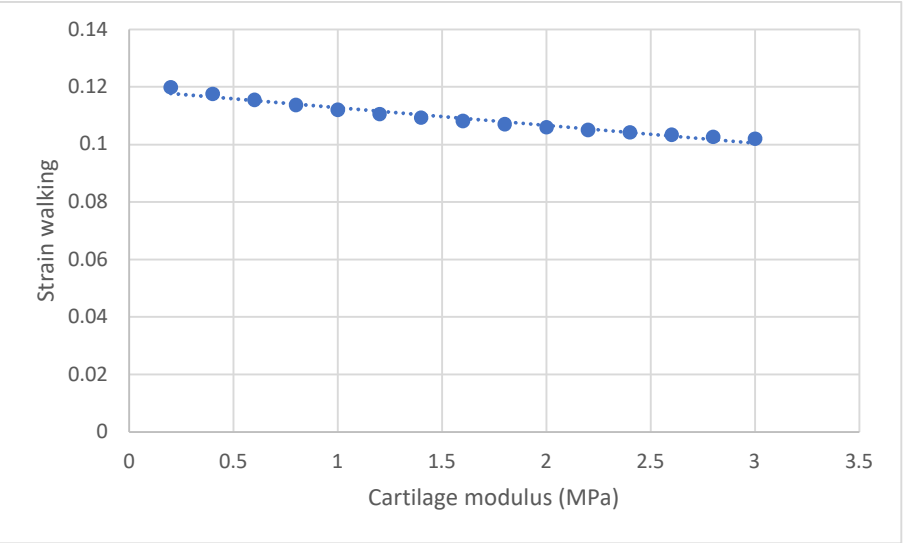

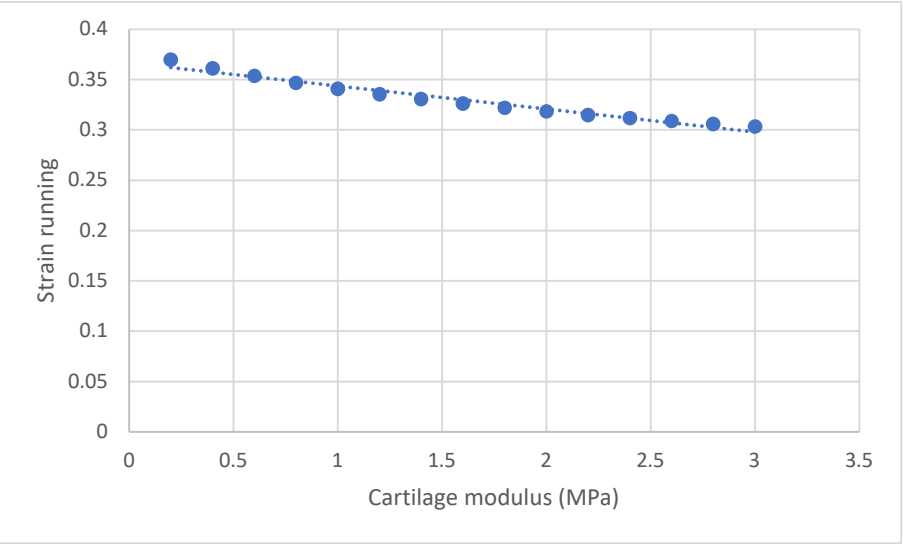

Uncovered tibial cartilage modulus

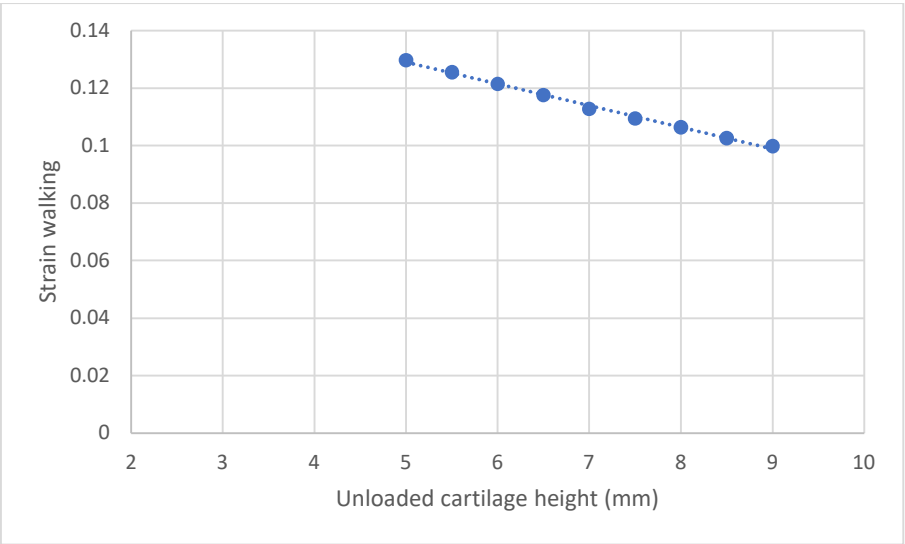

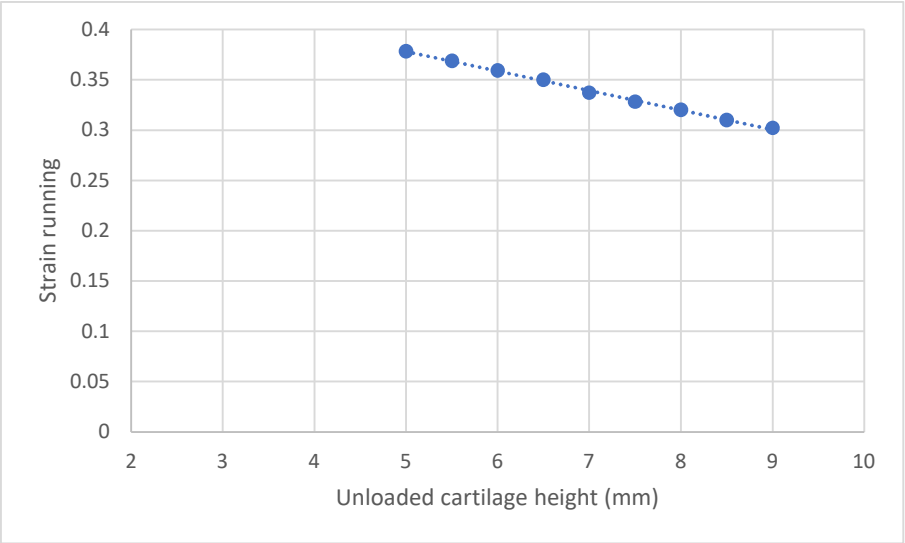

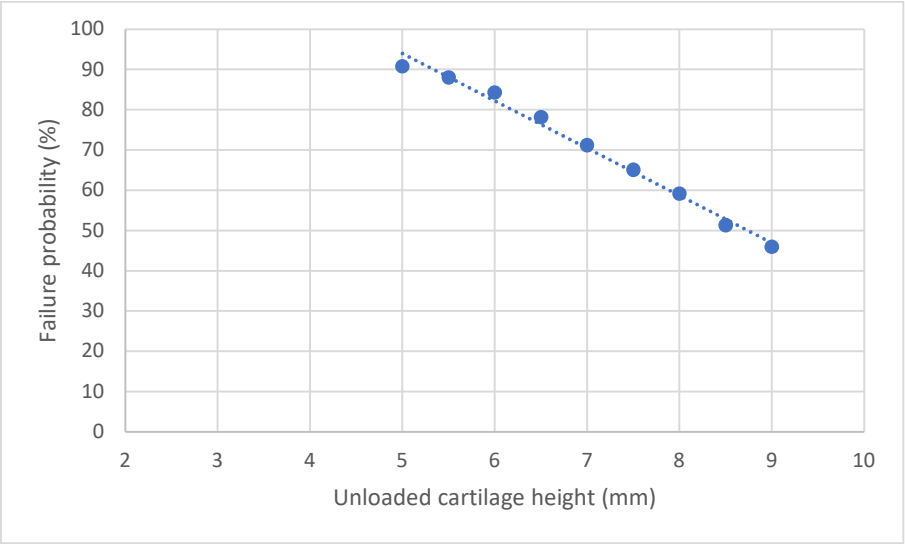

Meniscus modulus

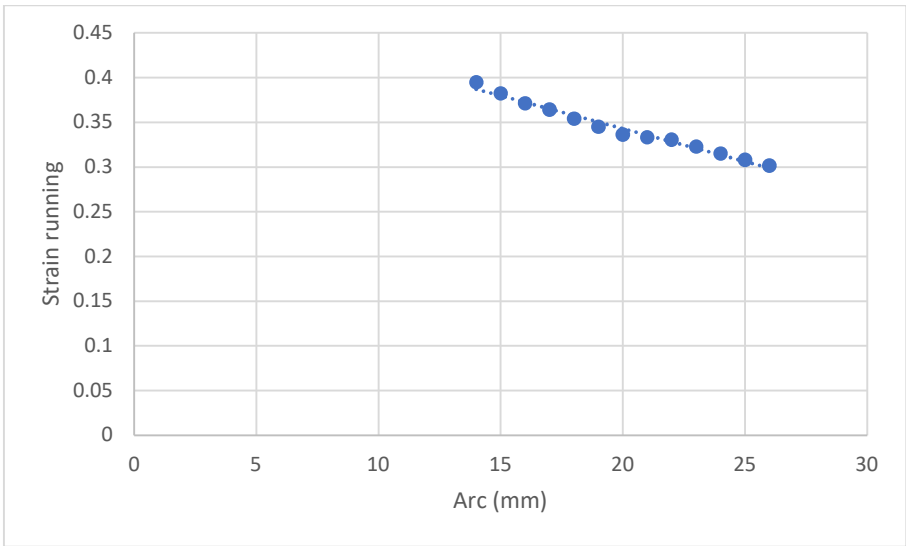

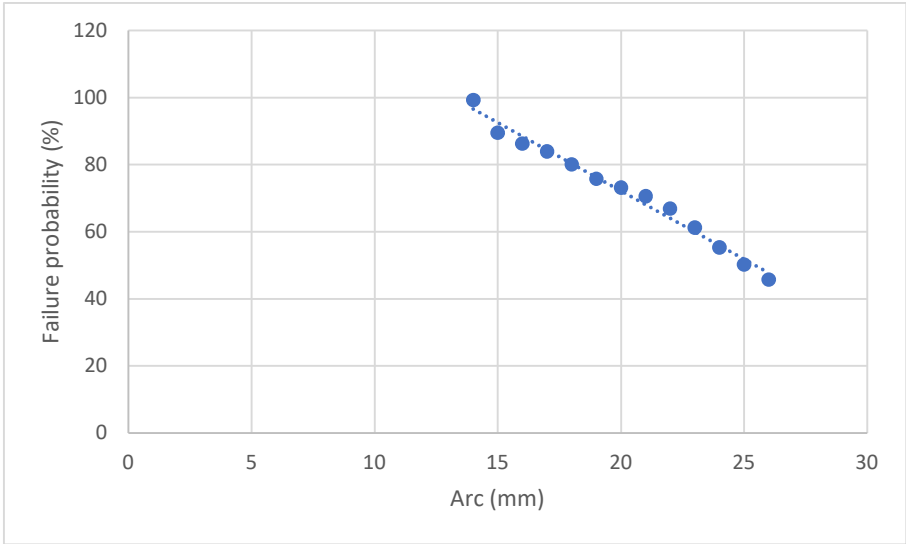

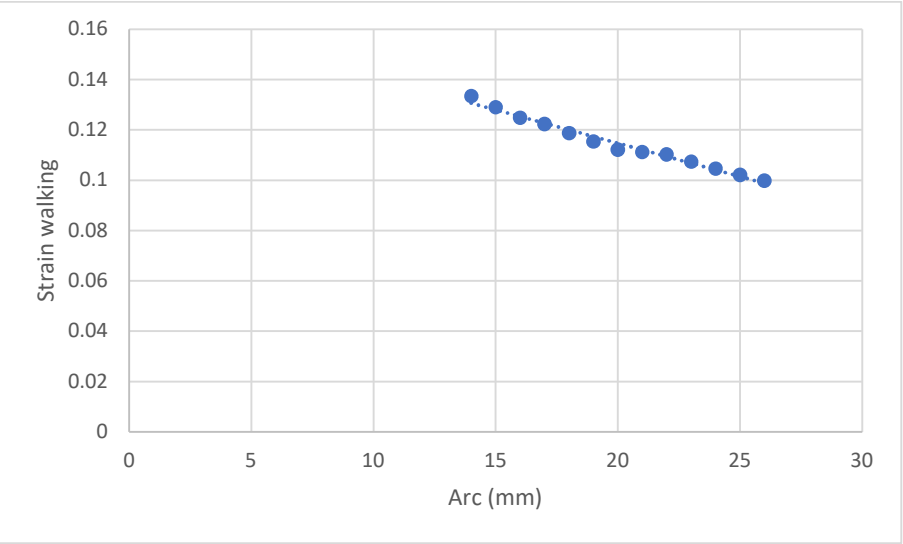

Unloaded cartilage height

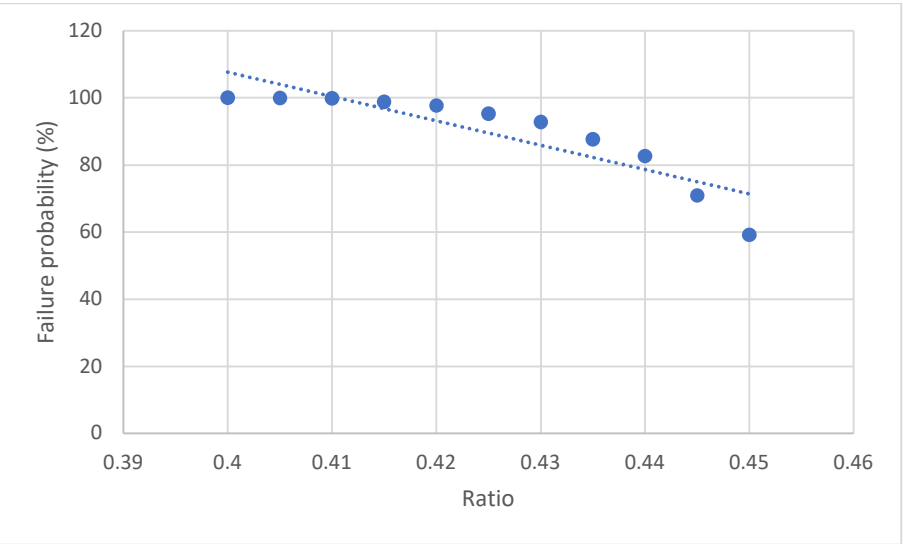

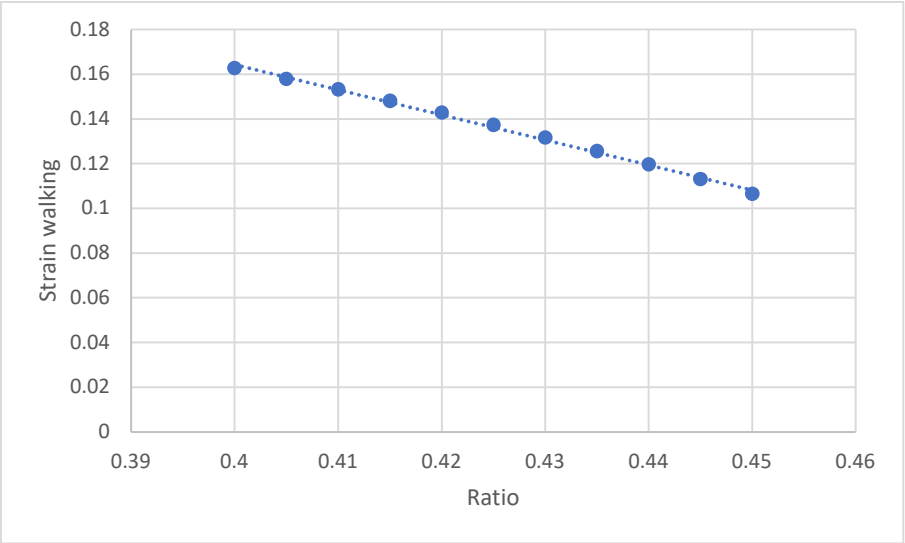

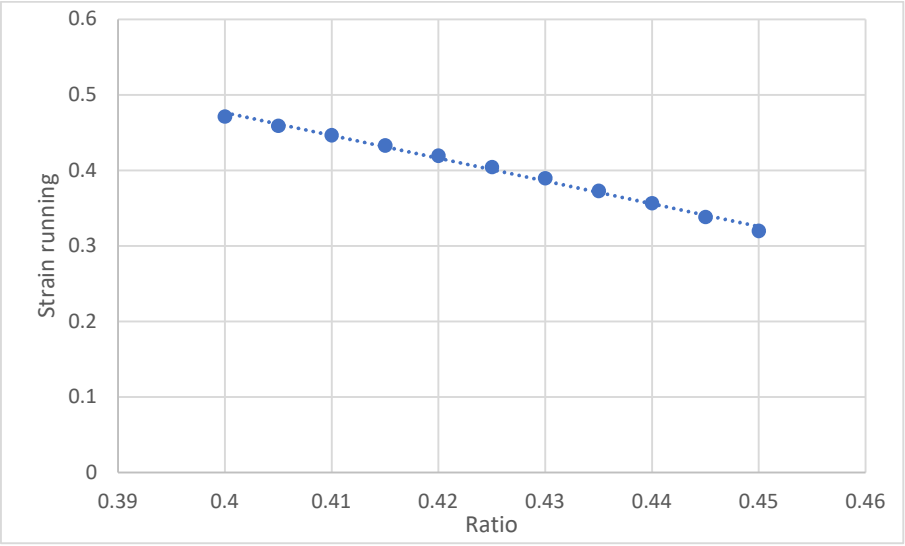

Frontal tibial arc

Poisson's ratio

Section S3.

1. Muscle forces

Table S3: Muscle force parameters during running.

	Non-habitual				Habitual			
	Minimal		Conventional		Minimal		Conventional	
	Mean	SD	Mean	SD	Mean	SD	Mean	SD
Peak biceps femoris long head force (BW)	0.43	0.14	0.49	0.17	0.39	0.08	0.40	0.13

Peak vastus medialis impulse (BW·ms)	161.5 1	23.1 0	175.4 4	31.2 2	160.5 6	37.2 8	165.9 9	46.0 1

In the habitual minimal footwear group, biceps femoris short head impulse ($b = 5.57$ (95% CI = 3.34 – 7.80), $t = 5.23$, $P < 0.001$), peak biceps femoris short head force ($b = 0.10$ (95% CI = 0.05 – 0.16), $t = 3.85$, $P = 0.001$), lateral gastrocnemius

impulse ($b = 10.88$ (95% CI = 4.53 – 17.22), $t = 3.59$, $P=0.002$), peak lateral gastrocnemius force ($b = 0.09$ (95% CI = 0.03 – 0.15), $t = 2.97$, $P=0.008$), medial gastrocnemius impulse ($b = 25.99$ (95% CI = 9.43 – 42.56), $t = 3.28$, $P=0.004$), peak medial gastrocnemius force ($b = 0.18$ (95% CI = 0.05 – 0.31), $t = 2.86$, $P=0.01$), sartorius impulse ($b = 2.70$ (95% CI = 1.63 – 3.78), $t = 5.26$, $P<0.001$) and peak sartorius force ($b = 0.01$ (95% CI = 0.001 – 0.03), $t = 2.33$, $P=0.031$) were significantly greater in the minimal in relation to conventional footwear. However, in the same group, peak vastus medialis force was significantly larger ($b = 0.10$ (95% CI = 0.01 – 0.20), $t = 2.42$, $P=0.039$) in the conventional compared to minimal footwear (Table S3).

In the non-habitual minimal footwear group, biceps femoris short head impulse ($b = 6.63$ (95% CI = 1.38 – 11.87), $t = 2.64$, $P=0.016$), peak biceps femoris short head force ($b = 0.10$ (95% CI = 0.04 – 0.16), $t = 3.39$, $P=0.003$), peak gracilis force ($b = 0.03$ (95% CI = 0.002 – 0.05), $t = 2.32$, $P=0.032$), lateral gastrocnemius impulse ($b = 14.54$ (95% CI = 9.31 – 19.78), $t = 5.82$, $P<0.001$) and peak lateral gastrocnemius force ($b = 0.10$ (95% CI = 0.01 – 0.19), $t = 2.44$, $P=0.025$) were significantly greater in the minimal in relation to conventional footwear. However, biceps femoris long head impulse ($b = 8.31$ (95% CI = 3.81 – 12.80), $t = 3.87$, $P=0.001$), rectus femoris impulse ($b = 15.61$ (95% CI = 2.45 – 28.78), $t = 2.48$, $P=0.023$), semimembranosus impulse ($b = 6.04$ (95% CI = 2.05 – 10.04), $t = 3.17$, $P=0.005$), vastus lateralis impulse ($b = 28.94$ (95% CI = 4.30 – 53.59), $t = 2.46$, $P=0.024$), vastus medialis impulse ($b = 13.93$ (95% CI = 0.51 – 28.37), $t = 2.40$, $P=0.048$) and vastus intermedius impulse ($b = 15.85$ (95% CI = 0.14 – 31.84), $t = 2.51$, $P=0.022$) were significantly in the conventional compared to minimal footwear (Table S3).

Section S4.

1. Spatiotemporal variables

Table S4: Spatiotemporal variables during walking.

	Non-habitual		Habitual	
	Mean	SD	Mean	SD
Velocity (m/s)	1.45	0.14	1.58	0.19
Stride length (m)	1.52	0.08	1.58	0.18

Walking velocity was found to be significantly faster in the habitual minimal footwear group ($b = 0.13$ (95% CI = 0.03 – 0.24), $t = 2.52$, $P=0.016$) (Table S4).

2. Joint contact forces

Table S5: Joint contact force parameters during walking.

	Non-habitual		Habitual	
	Mean	SD	Mean	SD
Peak medial tibiofemoral force (BW)	2.85	0.54	3.05	0.53

Medial tibiofemoral cumulative load (BW/m)	1.34	0.23	1.27	0.22
--	------	------	------	------

No significant differences in medial tibiofemoral forces were observed between groups (Table S5).

3. Stress/ strain

Table S6: Stress/ strain parameters during walking.

	Non-habitual		Habitual	
	Mean	SD	Mean	SD
Peak medial tibiofemoral stress (MPa)	2.22	0.53	2.35	0.34
Peak medial tibiofemoral strain	0.15	0.03	0.15	0.02

	Non-habitual				Habitual				
	Minimal		Conventional		Minimal		Conventional		
	Mean	SD	Mean	SD	Mean	SD	Mean	SD	
Peak lateral tibiofemoral force (BW)	4.38	0.98	4.00	0.55	3.80	0.72	3.74	0.69	<i>B</i>

No significant differences in medial tibiofemoral contact mechanics were observed between groups (Table S6).

Section S5.

1. Lateral tibiofemoral forces

	R ²	P
Peak medial tibiofemoral force (BW)	0.262	<0.001
Peak medial tibiofemoral stress (MPa)	0.152	0.01
Peak medial tibiofemoral strain	0.141	0.02

Table S7: Lateral joint contact force parameters

Notes: *B* = significant difference between minimal and conventional footwear in non-habitual group.

Section S6.

1. Regression analyses.

Table S7: Regression coefficient of determination values with running velocity as predictor.

2. Comparisons between footwear with running velocity included as a co-variate.

Habitual minimal footwear users

Peak medial tibiofemoral force ($b = 0.23$ (95% CI = -0.63 – 1.11), $t = 0.89$, $P=0.581$) was not significantly different between the conventional and minimal footwear. However, peak stress ($b = 0.48$ (95% CI = 0.06 – 0.95), $t = 1.98$, $P=0.048$) and strain ($b = 0.02$ (95% CI = 0.003 – 0.04), $t = 1.99$, $P=0.047$) were significantly greater in conventional footwear.

Non-habitual minimal footwear users

There were no differences in peak medial tibiofemoral force ($b = 0.15$ (95% CI = -0.39 – 0.69), $t = 0.55$, $P=0.59$), peak strain ($b = 0.27$ (95% CI = -0.13 – 0.67), $t = 1.37$, $P=0.18$) or peak stress ($b = 0.01$ (95% CI = -0.006 – 0.03), $t = 1.34$, $P=0.19$) between minimal or conventional footwear.
