## Figure S3:

Non-classical monocytes increase in virtually all RA patients at T1 and T2:

Legend Figure S3

Non-classical monocytes were determined by CD14 and CD16 staining. In RA patients, there was an increase in the absolute and relative number of non-classical monocytes, which in average became more dominant over time. Non-responders according to EULAR criteria[32] were labelled separately with RA_02, RA_13 and RA_14.
