Supplementary Material

With regards to the 6 patients who were reviewed due to vitreoretinal pathology, epiretinal membrane was reported in 4 (66.7%), vitreomacular traction in 2 (33.3%), and posterior vitreous detachment and lamellar macular hole in 1 (16.7%) patient each. 'Retinal lesions' predominantly included retinal naevi and congenital hypertrophy of the retinal pigment epithelium (CHRPE). 'Other' primary diagnoses included macular telangiectasia, sickle cell retinopathy, angioid streak-related choroidal neovascular membrane (CNV), posterior uveitis-related CNV, retinal dystrophies, retinal artery occlusions, post-operative cystoid macular oedema or uveitis, torpedo maculopathy, and idiopathic retinal changes.
