

Figure S1: Average time to external symptom appearance caused by *Foc* TR4 infection. **a)** Time to external symptom appearance over two crop cycles. **b)** n values for corresponding data points shown in a). Error bars for each cultivar represent the 95% confidence interval for the mean.

Figure S2: Presence of external and internal symptoms on the two most susceptible cultivars i) Williams and ii) DPM25. Symptoms noted in susceptible cultivars included **a)** leaf chlorosis and necrosis and **b)** the presence of internal symptoms within the pseudostems.

Figure S3: PCR amplification of products of pure *Foc* TR4 cultures isolated from pseudostems of cultivars showing signs of infection. M indicates the use of a molecular marker 1Kb DNA plus ladder.
