

---

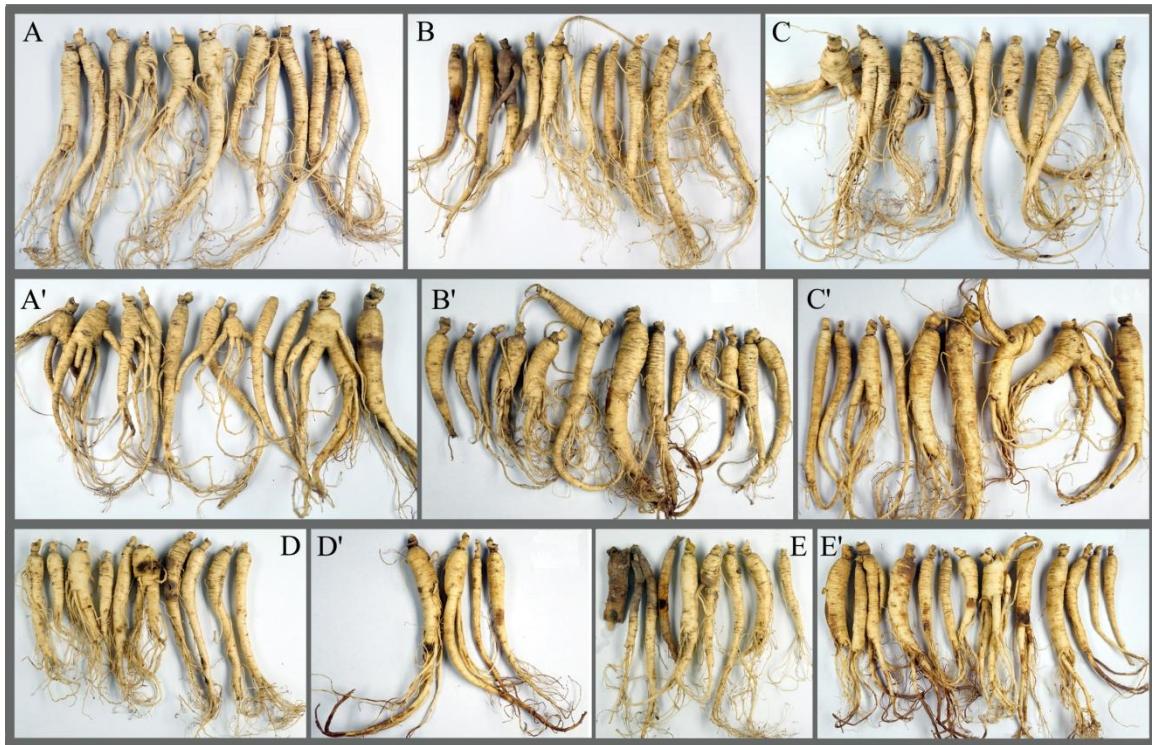

Supplementary Materials for

**Genetic diversity and population structure of  
*Cylindrocarpon*-like fungi infecting ginseng roots in  
Northeast China**

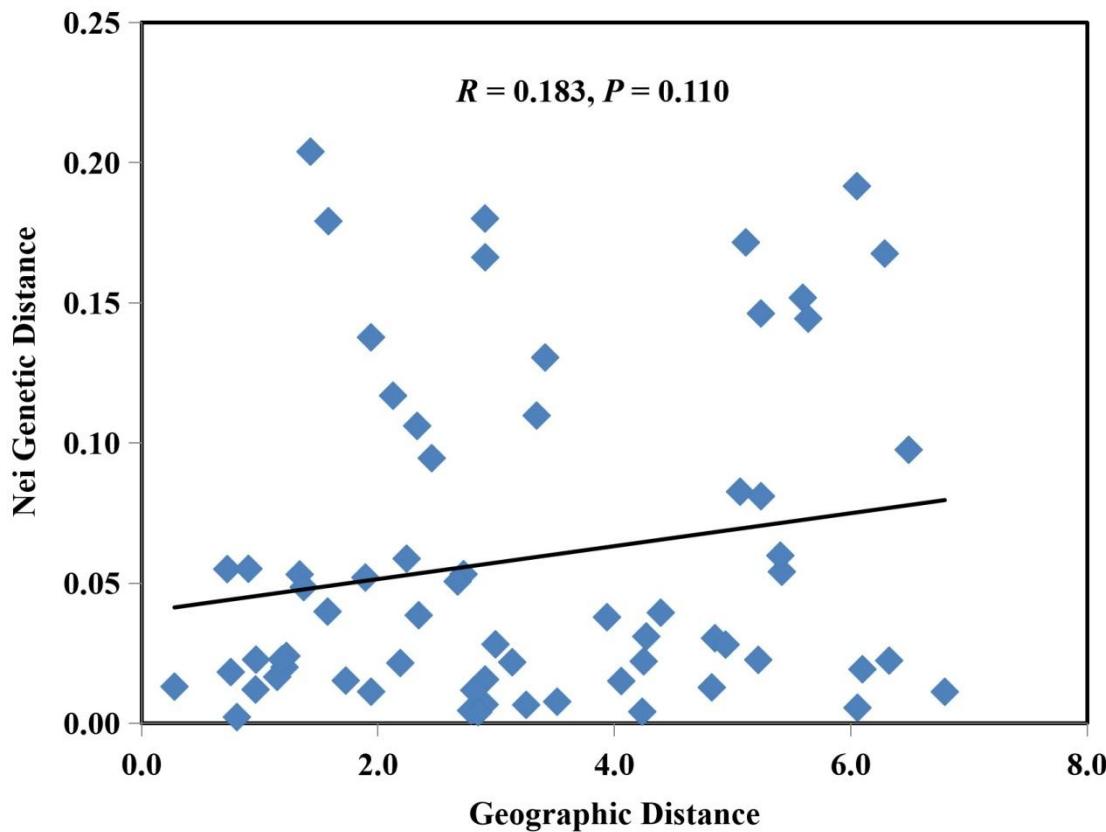

**Figure S1 to S8 & Table S1 and S2**

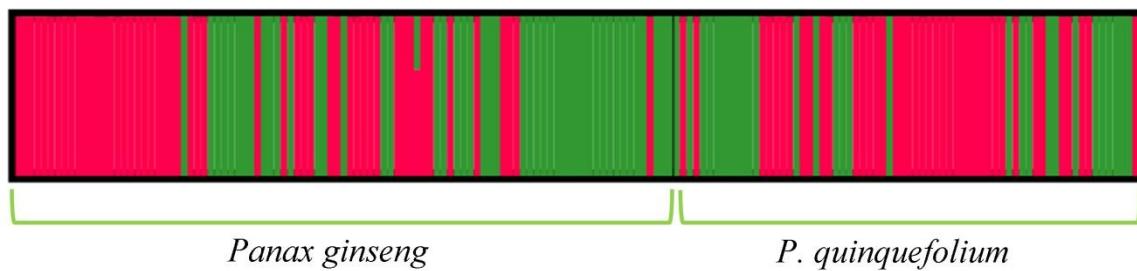

**Figure S1.** Pathogenicity test of CLF isolates obtained from *Panax ginseng* roots. A to H: virulence on *P. ginseng*, A' to H': virulence on *P. quinquefolius*; A & A': mock; B & B': *Dactylolectria hordeicola*; C & C': *Dactylolectria* sp.; D & D': *Ilyonectria changbaiensis*; E & E': *I. communis*; F & F': *I. mors-panacis*; G & G': *I. qitaiheensis*; H & H': *I. robusta*.

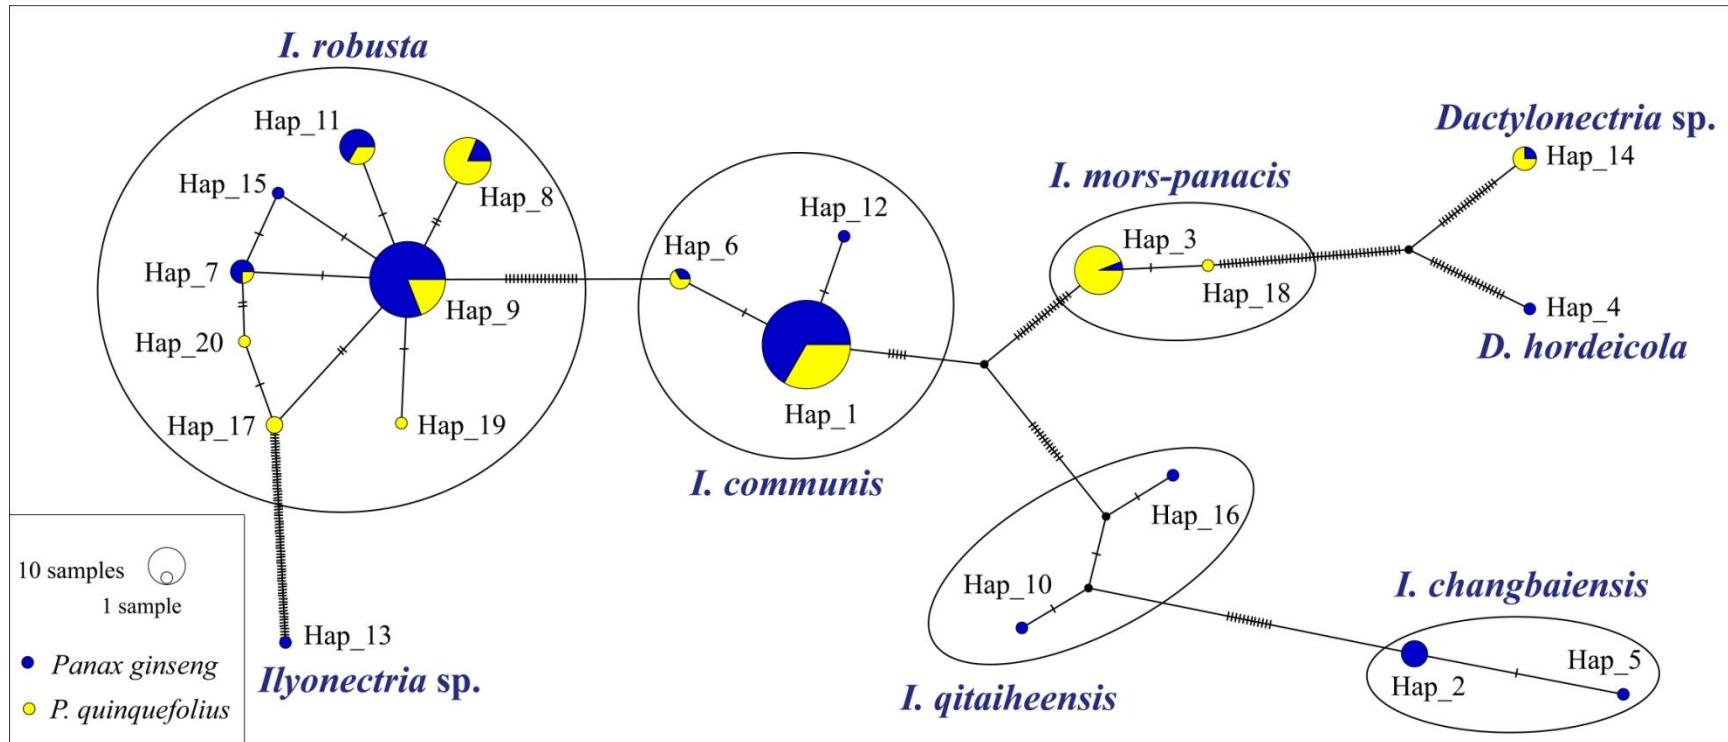

**Figure S2.** Pathogenicity test of CLF isolates obtained from *P. quinquefolius* roots. A to H: virulence on *P. quinquefolius*, A' to H': virulence on *P. ginseng*; A & A': mock; B & B': *Dactylonectria* sp.; C & C': *Ilyonectria communis*; D & D': *I. mors-panacis*; E & E': *I. robusta*.

**Figure S3.** Correlation between genetic differentiation based on Nei's genetic distance and geographic distance among 12 populations of CLF isolates by using Mantel test with GenAIEx.

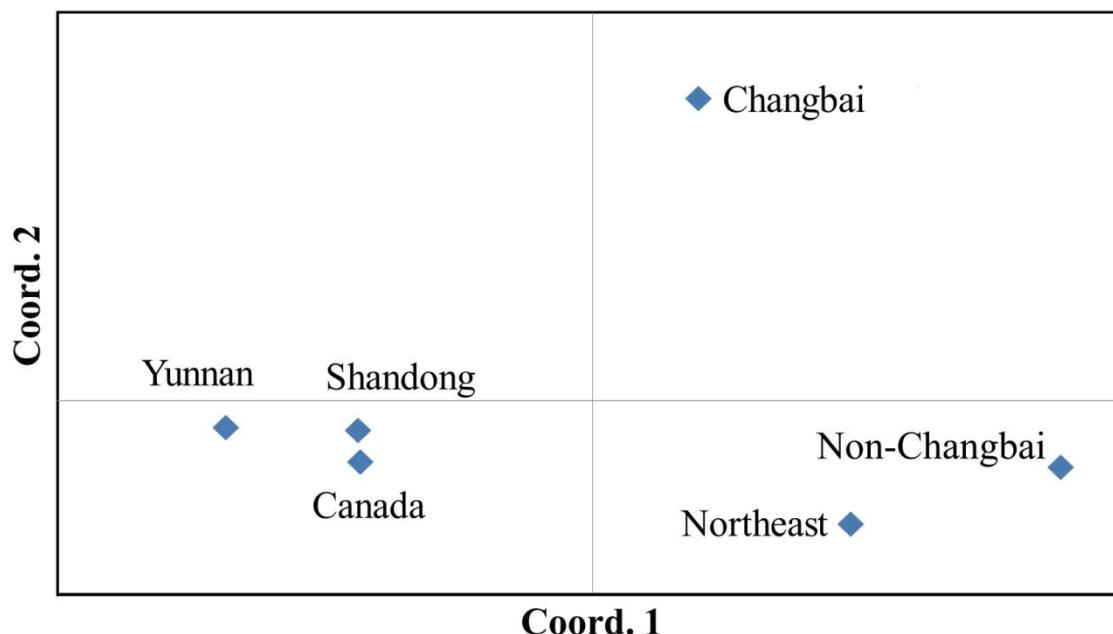

**Figure S4.** Population structure of CLF isolates analyzed by using STRUCTURE program. Two clusters ( $K = 2$ ) were identified from two populations sampled from *Panax ginseng* and *P. quinquefolium* respectively.

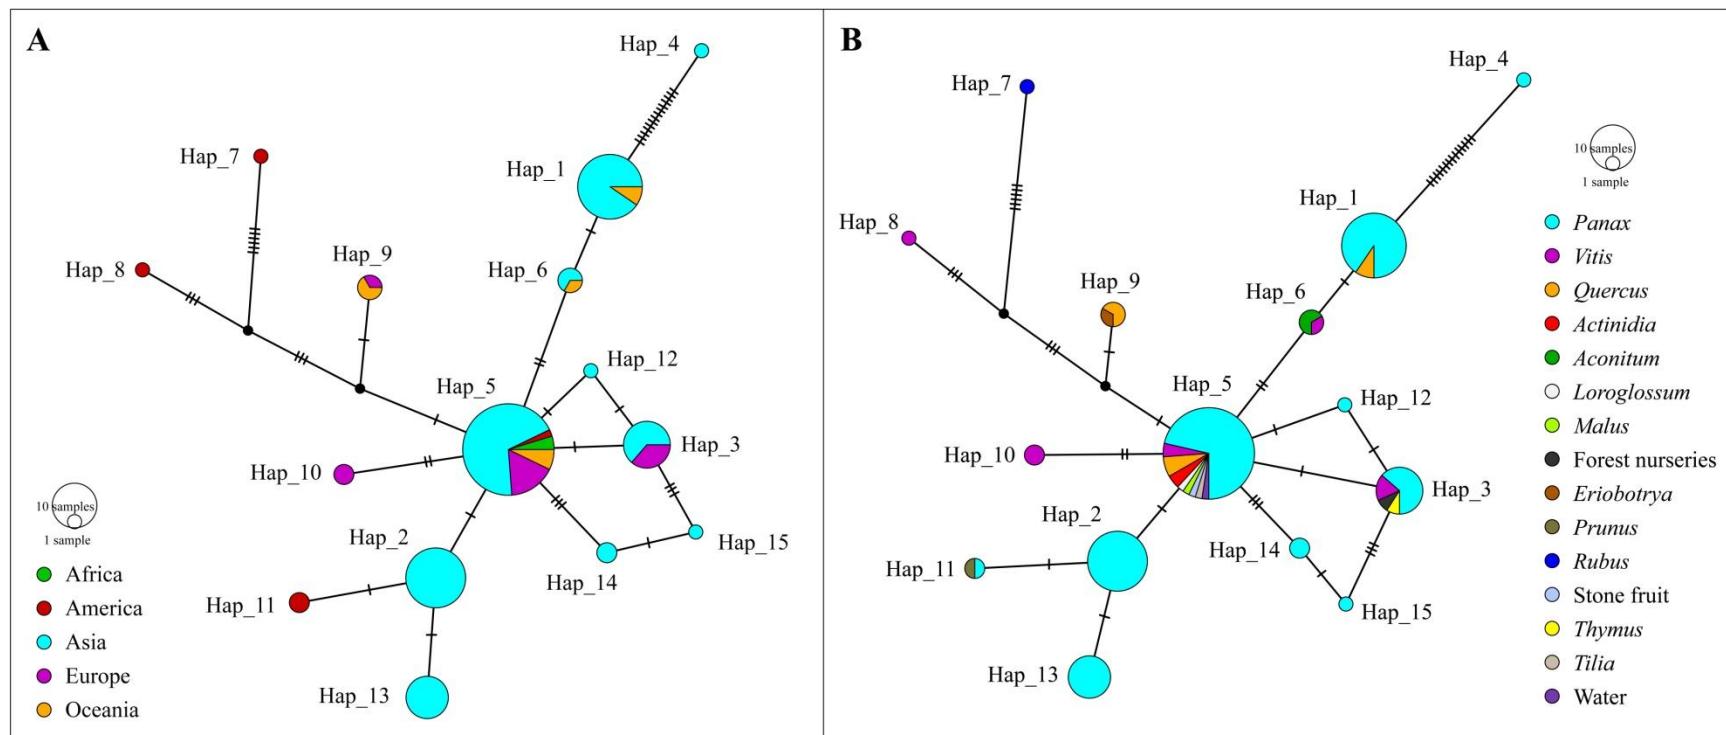

**Figure S5.** TCS haplotype network based on partial sequence of the *his3* gene representing two populations of CLF isolates from *Panax ginseng* (blue) and *P. quinquefolius* (yellow). The size of the circle represents the haplotype frequencies in populations. Hatch marks indicate the number of mutations.

---

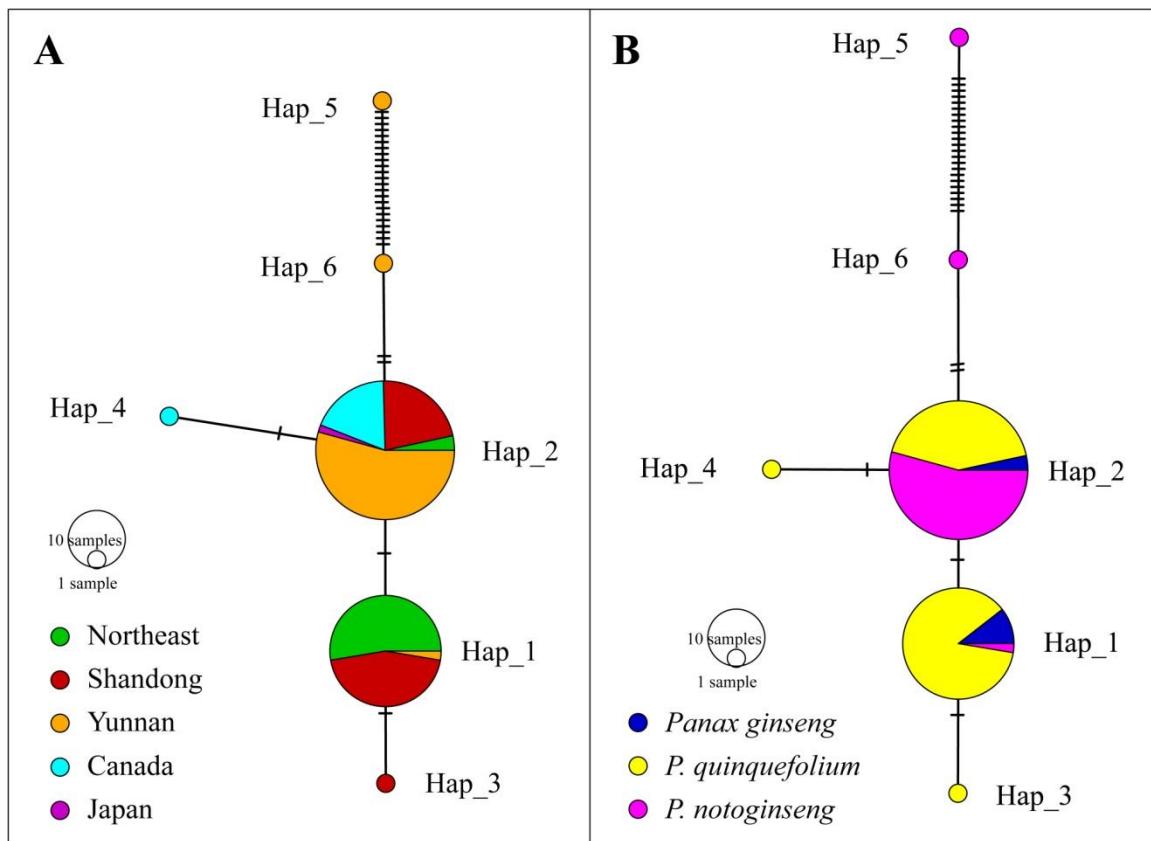

### Principal Coordinates (PCoA)

**Figure S6.** Principal coordinate analysis of 6 populations of CLF isolates from *Panax* species worldwide based on Nei's genetic distance by using GenAIEx. Axes 1 and 2 of the PCoA accounted for 83.21% and 11.96% of the total genetic variation.

**Figure S7.** TCS haplotype network based on partial sequence of the *his3* gene representing worldwide *Ilyonectria robusta* isolates. A: geographical populations; B: populations divided based on hosts. The size of the circle represents the haplotype frequencies in populations. Hatch marks indicate the number of mutations.

**Figure S8.** TCS haplotype network generated based on partial sequence of the *his3* gene representing worldwide *Ilyonectria mors-panacis* isolates. A: geographical populations; B: populations divided based on hosts. The size of the circle represents the haplotype frequencies in populations. Hatch marks indicate the number of mutations.

**Table S1. CLF isolates obtained from *Panax ginseng* or *P. quinquefolius* in Northeast China**

Isolate number	Species	Host	Location(province, city, county, town)	Year collected	Haplotype	GenBank accession number	Population code	Latitude, longitude
301	<i>I. communis</i>	<i>P. ginseng</i>	Jilin, Baishan, Changbai, Baoquanshan	2012	Hap_1	MF350433	JBC	41.52N, 127.46E
320	<i>I. changbaiensis</i>	<i>P. ginseng</i>	Jilin, Baishan, Changbai, Baoquanshan	2012	Hap_2	MF350443	JBC	41.52N, 127.46E
408	<i>I. communis</i>	<i>P. ginseng</i>	Jilin, Baishan, Changbai, Baoquanshan	2012	Hap_1	-	JBC	41.52N, 127.46E

"-" means that the isolate shares the same sequences with other isolates belonging to the same haplotype. Therefore at least one GenBank accession number was provided for each haplotype.

**Table S2. CLF isolates used in worldwide genetic diversity and population structure analyses**

Isolate number	Species	Host	Location	GenBank accession number	Population code
