**Supplementary Figure S1.** Amino acid sequence alignment of the *Yck1* (YHR135C) and *Yck2* (YNL154C) proteins from *S. cerevisiae* with Ck1 proteins from *C. neoformans* (CNA05390), *M. oryzae* (MGG\_08097), *F. oxysporum* Ck1 (FOXG\_05428) and *V. dahliae* (VDAG\_08537).

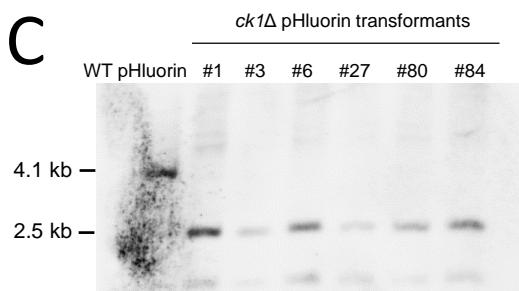

A

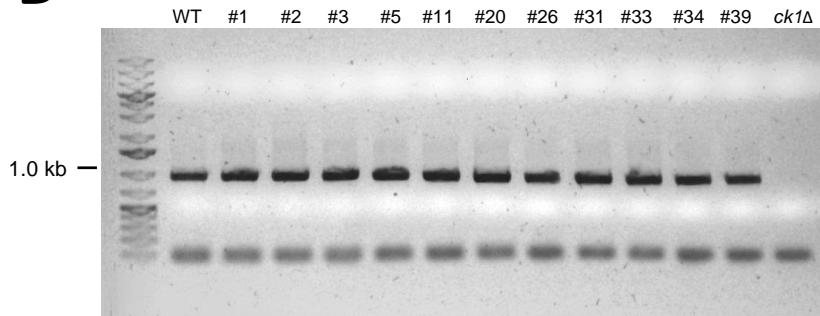

B

C

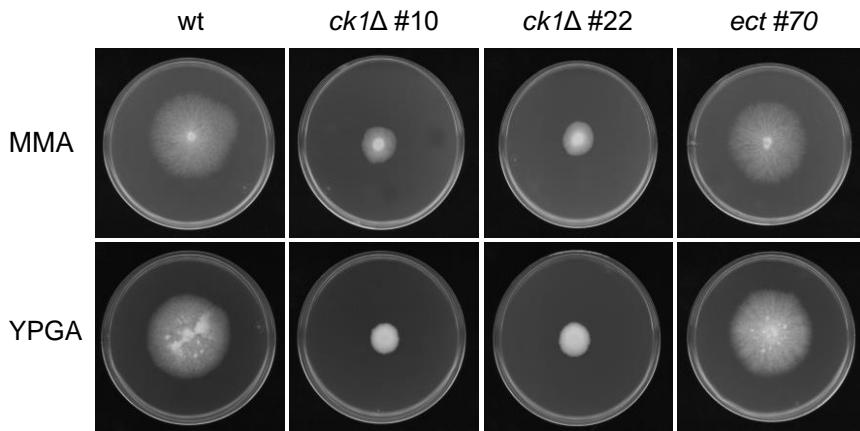

D

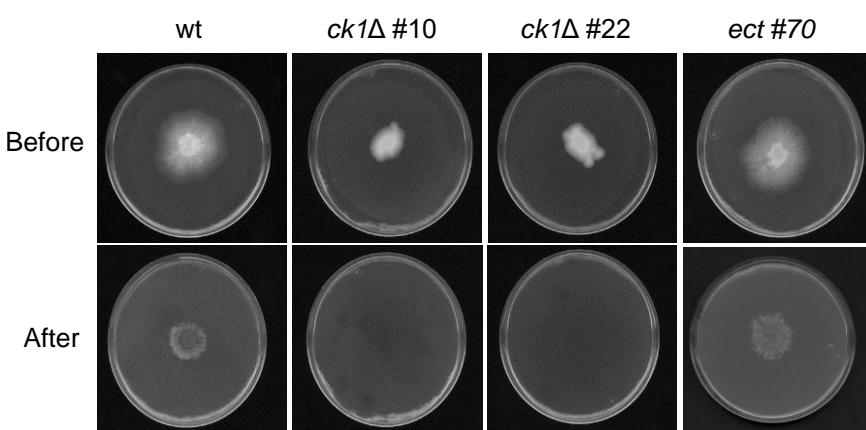

**Supplementary Figure S2.** Targeted replacement of the *ck1* gene in the *F. oxysporum* wild type and pHluorin-expressing strain (A) Physical maps of the *F. oxysporum* *ck1* locus and of the split-marker gene replacement constructs obtained by fusion PCR. Relative positions of restriction sites and PCR primers are indicated. *hyg*, hygromycin resistance gene. (B) Southern blot analysis of genomic DNA of the wild type strain (WT) and six independent transformants, treated with *PstI*, separated on a 0.7% agarose gel, transferred to a nylon membrane and hybridized with the DNA probe indicated in (A). (C) Southern blot analysis of genomic DNA of the pHluorin-expressing background strain (pHluorin) and six independent transformants, treated with *NsiI*, separated on a 0.7% agarose gel, transferred to a nylon membrane and hybridized with the DNA probe indicated in (A). (D) PCR amplification of genomic DNA of the WT, the *ck1* $\Delta$  and eleven independent complemented transformants, using primers Ck1-Fwd and Ck1-Rv indicated in (A).

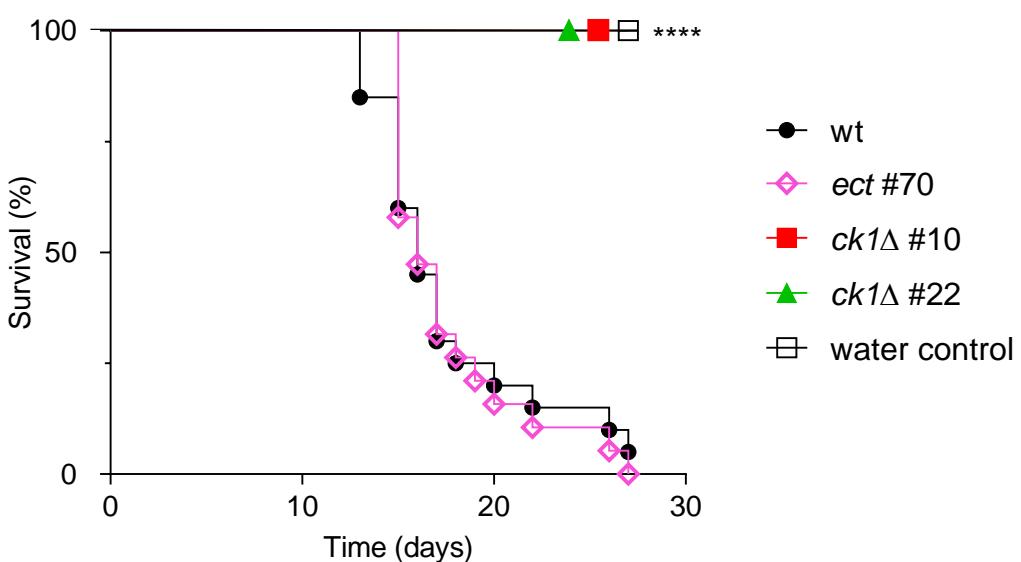

A

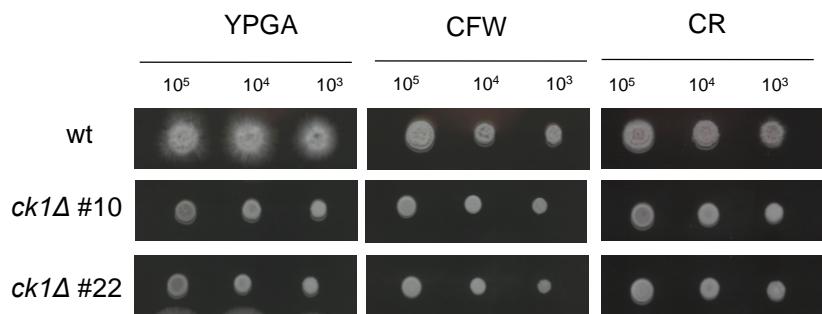

B

C

**Supplementary Figure S3.** Ck1 is required for growth, invasion and pathogenicity of *F. oxysporum*. (A) Aliquots of  $5 \times 10^4$  fresh microconidia of the indicated strains were spot-inoculated on MMA or YPGA plates. Colonies were imaged 3 days after inoculation. (B) Aliquots of  $5 \times 10^4$  fresh microconidia of the indicated strains were spot-inoculated on the top cellophane membranes placed on unbuffered MMA plates. Colonies were imaged 3 days after inoculation (before), then the cellophane membrane with the fungal colony was removed and plates were incubated for an additional day to visualize the presence on the plate, indicative of penetration through the cellophane (after). (C) Kaplan-Meier plots showing survival of tomato plants (cv. Moneymaker) inoculated by dipping roots into a suspension of  $5 \times 10^6$  fresh microconidia/mL of the indicated fungal strains. Survival of tomato plants was recorded for 27 days. Twenty plants were used per treatment.  $p < 0.0001$ (\*\*\*\*) versus wt according to log-rank test. All data shown are from one representative experiment. Experiments were performed twice with similar results.

**Supplementary Figure S4.** Ck1 is not required for the response of *F. oxysporum* to cell wall stress. Aliquots of  $10^5$ ,  $10^4$  and  $10^3$  fresh microconidia of the indicated strains were spot-inoculated on YPGA plates in the absence or presence of 50 $\mu$ g/ml Calcofluor White (CFW) or 100 $\mu$ g/ml Congo Red (CR). The plates were imaged after two days of incubation at 28°C. Images are from one representative experiment. Experiments were performed twice, each with three independent plates per growth condition.

**Supplementary Figure S5.** Amino acid sequence alignment of Pma1 proteins from *S. cerevisiae* (YGL008C), *V. dahliae* (XP\_009652327), *M. orzae* (MGG\_07200), *N. crassa* (NCU01680), *T. reesei* (TRIREDRAFT\_78757), *F. graminearum* (FGRAMPH1\_01G03505), *F. oxysporum* (FOXG\_11289), *F. verticillioides* (FVEG\_09502), *C. neoformans* (CNAG\_03565), *A. nidulans* (AN4859) and *Z. triciti* (ZTRI\_5.411). Boxed in red is the Ser-507 in *S. cerevisiae* Pma1 and the corresponding Thr residue conserved in filamentous fungi. Boxed in green is the consensus phosphorylation motif for Ck1.
