SUPPLEMENTARY METHODS

Metrics Definitions

Sensitivity was defined as:

$$\frac{\text{True Positives}}{\text{True Positives} + \text{False Negatives}}$$

Specificity was defined as:

$$\frac{\text{True Negatives}}{\text{True Negatives} + \text{False Positives}}$$

Positive Predictive Value was defined as:

$$\frac{\text{True Positives}}{\text{True Positives} + \text{False Positives}}$$

Negative Predictive Value was defined as:

$$\frac{\text{True Negatives}}{\text{True Negatives} + \text{False Negatives}}$$

Accuracy was defined as:

$$\frac{\text{True Positives} + \text{True Negative}}{\text{True Positives} + \text{False Negative} + \text{False Positives} + \text{True Negative}} \times 100$$

The *Matthews correlation coefficient* was defined as:

$$\frac{\text{True Positives} \times \text{True Negatives} - \text{False Positives} \times \text{False Negatives}}{\sqrt{(\text{True Positives} + \text{False Positives})(\text{True Positives} + \text{False Negatives})(\text{True Negatives} + \text{False Positives})(\text{True Negatives} + \text{False Negatives)}}$$

The *Youden's Index* was defined as:

$$\frac{\text{True Positives}}{\text{True Positives} + \text{False Negative}} + \frac{\text{True Negatives}}{\text{True Negatives} + \text{False Positives}} - 1$$

SUPPLEMENTARY TABLE LEGEND

Supplementary Table 1 Values of npresel and presel features that were evaluated in combination with other hyperparameters for model selection.

Abbreviations: npresel, number of pre-selected features; sel, number of selected features.

Supplementary Table 2 Univariate ranking of variants. Only the first 30 variants are shown as example due to space constraints.

Supplementary Table 3 Sets of hyperparameters evaluated before choosing the final model.

Abbreviations: corr, correlation value; npresel, number of pre-selected features; sel, number of selected features.

Supplementary Table 4. List of selected variants entering Logic Learning Machine (LLM) model.

Supplementary Table 5 Summary Table of performance based on different sets of hyperparameters.

“errmax” represents the maximum level of error for each rule included in the ruleset. In other words, this corresponded to the maximum percentage of cases belonging to output classes different from the predicted one which verified the rule.

Abbreviations: errmax, maximum level of error for each rule; PPV, Positive Predictive Value; NPV, Negative Predictive Value.

Supplementary Table 6. Covering and error of each condition within the best rule including sex.

“Covering” is the percentage of samples belonging to the class described by the rule, fulfilling that specific rule; “Error” is the percentage of samples belonging to the other classes fulfilling that specific rule.

Supplementary Table 7. Covering and error of each condition within the best rule without sex.

“Covering” is the percentage of samples belonging to the class described by the rule, fulfilling that specific rule; “Error” is the percentage of samples belonging to the other classes fulfilling that specific rule.
