

Monitoring of carbon stocks in pastures in the savannas of Brazil through ecosystem modeling on a regional scale

Supplementary material

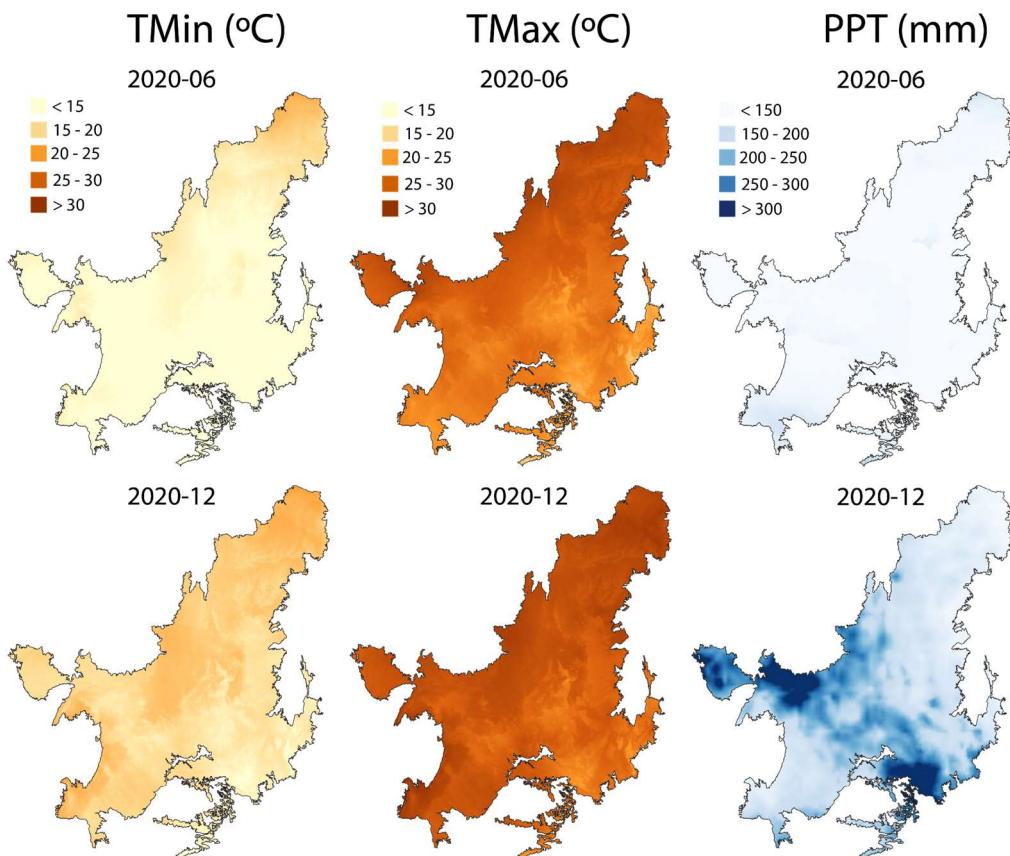

Figure S1: Maps of climate variables in the Cerrado, obtained from the Terraclimate database, and used to model carbon stocks in the pasture areas of the Biome. (TMIN - Minimum temperature; TMAX - Maximum temperature; PPT - Precipitation; For illustration, we used data from June/2020 and December/2020).

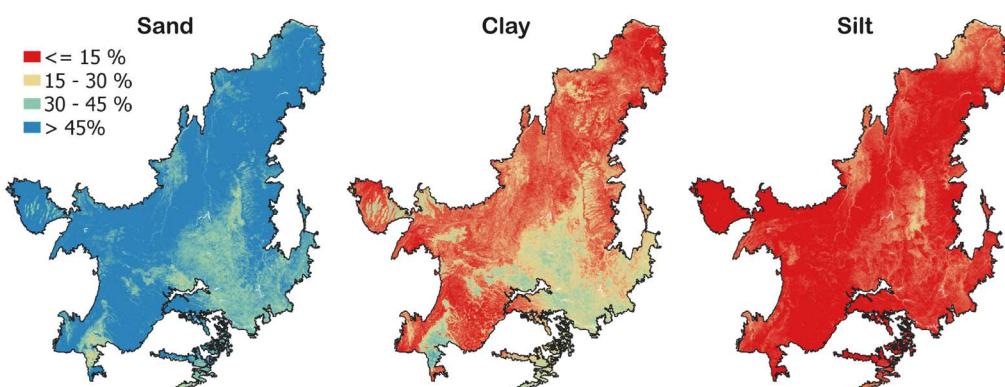

Figure S2: Soil texture maps in the Cerrado, obtained from the SoilGrids database and used to model carbon stocks in the pasture areas of the Biome. Density and acidity (Ph) maps were obtained on the same basis.

Spatial variation in carbon stock

- █ >10 %
- █ 10 %
- █ 0.0 %
- █ -10 %
- █ <-10 %

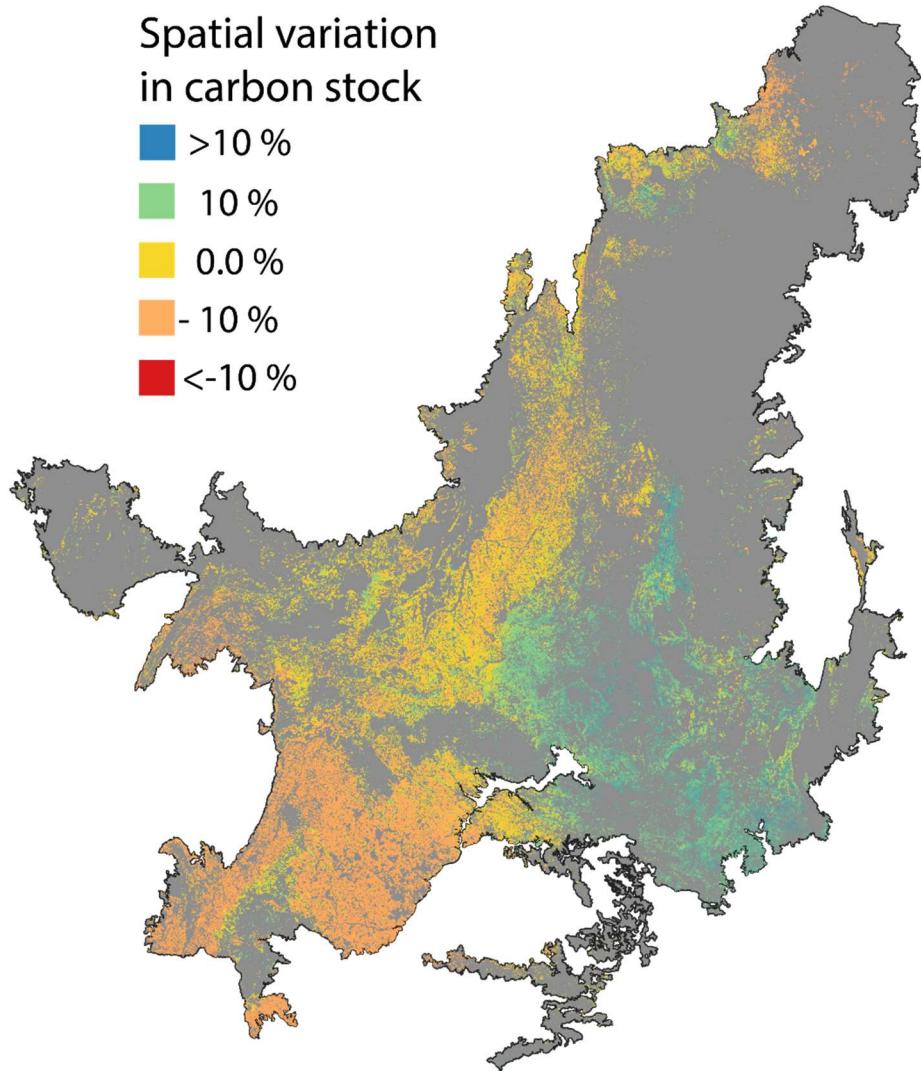

Figure S3: % difference between local and mean SOC stock in the pasture areas of the Cerrado biome (layer 0-20 cm).

The % difference was calculated based on the following equation:

$$X_{i\%} = \left(\frac{X_i}{\bar{X}} - 1 \right) * 100$$

Where: $X_{i\%}$ is the SOC stock for a given pixel X_i and \bar{X} is the mean SOC stock for all the pixels corresponding to the Cerrado pastures.

Table S1: Location and soil characteristics in the 0-20 cm layer of the sites used in the calibration and validation process of the century model to represent pasture areas in the Cerrado.

State	Municipalities	Pasture age (years)	Carbon MgC/ha ⁻¹	Sand (%)	Silt (%)	Clay (%)	Density (g/cm ³)	p.H	Annual precipitation (mm)
MT	Barra do Garças	27	33.45	59.50	19.00	21.50	1.4	6.0	1242.38

Table S2: Modified parameters in Century to simulate traditional pasture management in the Cerrado biome.

	Default of model	Pasture conventional management
Crop.100 file		
PRDX(1) : potential aboveground monthly production for crops (g C m^{-2})	0.3	0.3
PPDF(1) : optimum temperature for production for parameterization	30	22
CFRTCN(1): maximum fraction of C allocated to roots under maximum nutrient stress	0.4	0.3
CFRTCN(2): minimum fraction of C allocated to roots with no nutrient stress	0.25	0.25
CFRTCW(1): maximum fraction of C allocated to roots under maximum water stress	0.6	0.4
CFRTCW(2): minimum fraction of C allocated to roots with no water stress	0.2	0.1
Tree.100 file		
PRDX(1): potential aboveground monthly production for crops (g C m^{-2})	0.5	0.26
