

Association between microbiome-related human genetic variants and fasting plasma glucose in a high-cardiovascular risk Mediterranean population

Eva M Asensio, Carolina Ortega-Azorín, Rocío Barragán, Andrea Alvarez-Sala, José V. Sorlí, Eva C. Pascual, Rebeca Fernández-Carrión, Laura V Villamil, Dolores Corella, Oscar Coltell

SUPPLEMENTAL TABLES AND FIGURES

Table S1. Microbiome-related SNPs selected for this study: initial mbGWAS generating the association (STD#), SNP location and microbial trait.

Table S2. Association between the ordered (by p-value) microbiota-related SNPs and fasting glucose in the whole population1 (continuation of Table 2)1.

Table S3. Association between the microbiota-related SNPs and diabetes in non-diabetic subjects1.

Table S4. Interaction between the top-ranked microbiota-related SNPs and sex on plasma fasting glucose in the whole population1.

Table S5. Selected instruments for the Two-sample Mendelian randomization analysis on plasma glucose.

Table S1. Microbiome-related SNPs selected for this study: initial mbGWAS generating the association (STD#), SNP location and microbial trait.

¹: N = 1020 subjects. Model adjusted for sex, age, type 2 diabetes, BMI and medication. Chr: Chromosome. Beta: indicates the effect for the minor allele on fasting plasma glucose. p: P-value obtained in the multi-variable linear regression model adjusted for sex, age, type 2 diabetes, BMI and medication for each SNP using a genetic additive model. MAF: Minor Allele Frequency in this population.

Note: this table is the continuation of Table 2, then only SNPs from p>0.1209 to p≤0.3350 are shown.

Table S3. Association between the microbiota-related SNPs and diabetes in non-diabetic subjects¹.

¹: N = 1020 subjects. Chr: Chromosome. Beta: indicates the effect for the minor allele on fasting plasma glucose concentrations. Beta 1 and SE 1: indicates the regression coefficients and SE in men (50%). Beta 2 and SE 2: indicates the regression coefficients and SE in women. p_GxSex: indicates the p-value for the interaction term between each SNP and sex in the corresponding hierarchical general linear regression model including the main effects and interaction terms in the whole population. MAF: minor allele frequency.

SE: Standard error. EF: Effect allele. MAF: Minor Allele Frequency.

¹: The association between the effect allele genetic variant (instrumental variable) and the exposure (Microbiome) was obtained from summary statistics published by Qin Y, et al. 2022 [51]. The effet allele for the exposure was harmonized to obtain a positive Beta (increasing effect in the exposure).

²: The second population was our Mediterranean population where the Beta was expressed for the same effect allele considered for the exposure.
