

## Supplementary Tables

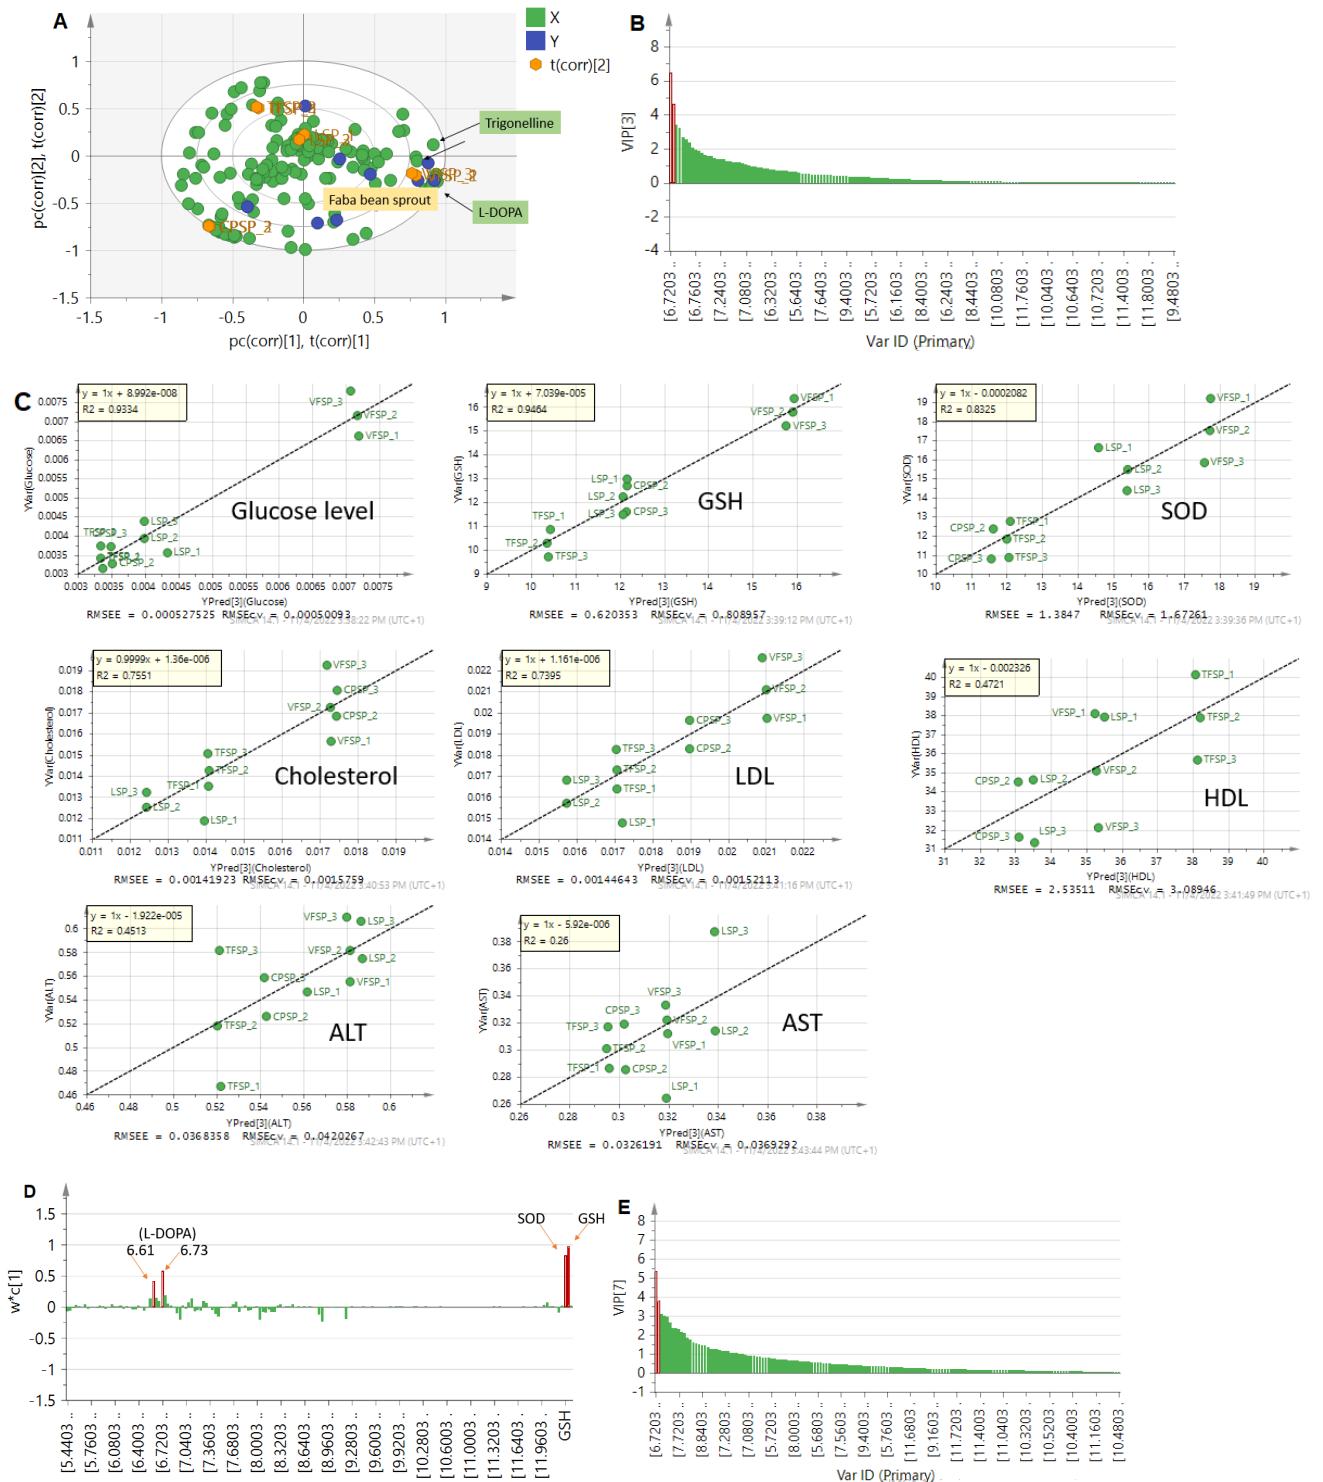

**Table S1:**  $^1\text{H}$ -NMR quantification of major primary and secondary metabolites in different samples of legume sprouts methanol extracts. Values are expressed as  $\mu\text{g}/\text{mg}$  dry powder  $\pm$  S.D (n=3). Chemical shifts used for metabolite quantification were determined in methanol- $d_6$  and expressed as relative values to HMDS (0.94 mM final concentration) Statistical analysis is carried out by one-way analysis of variance (ANOVA) where unshared letters between groups are the significance value at  $p < 0.05$ .

ID	Compound	Amount $\mu\text{g}/\text{mg}$ dry matter			
		Chickpea	Lentil	Fenugreek	Faba bean
1	$\omega$ -6 Fatty acid	51.19 $\pm$ 4.58 <sup>a</sup>	41.32 $\pm$ 4.26 <sup>bc</sup>	38.16 $\pm$ 1.78 <sup>c</sup>	47.77 $\pm$ 4.12 <sup>ab</sup>
2	$\omega$ -3 Fatty acid	20.12 $\pm$ 1.76 <sup>a</sup>	11.96 $\pm$ 0.85 <sup>b</sup>	21.69 $\pm$ 0.49 <sup>a</sup>	13.00 $\pm$ 1.30 <sup>b</sup>

## Supplementary Figures

**Figure S1.** **A:** Biplot, **B:** VIP score plot, and **C:** Observed versus predicted effect for GSH, SOD, and glucose level, showing correlation of antioxidant and glucose lowering effects in relation to binned metabolites by NMR in aromatic region ( $\delta_H$  5.5-11.0 ppm). **D:** Loading bar plot and **E:** VIP score after exclusion of glucose level.

**Figure S2.** Y-observed versus Y-predicted plot showing the constructed model's goodness of fit based on metabolites quantified by NMR in legume sprouts against values of various biomarkers used for evaluation of antidiabetic effect.

**Figure S3:** Permutation tests ( $n=100$ ) of the various antidiabetic biomarkers modelled for phytochemicals identified by NMR in legume sprouts.
