

Appendix 1

Study Title

Echinacea as a Potential Force against Coronavirus Infections? A Mini-Review of Randomized Controlled Trials in Adults and Children

Aim

The goal of this review was to identify coronavirus infections in clinical studies on Echinacea and to evaluate preventive and treatment benefits.

Methods

The Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines were followed to conduct and write this review [1].

Eligibility Criteria for Study Selection

Eligible studies were selected based on the following criteria:

- (i) studies reporting original data on effect of Echinacea on respiratory tract pathogens
- (ii) studies were analyzed if they reported human sampling and assessed the effect of prevention or therapy with *Echinacea species* such as *Echinacea* or *Echinacea purpurea* or *Echinacea* or coneflower, which have been identified as playing a role in evidence for in vivo and in vitro activity against coronavirus infections
- (iii) we included randomized controlled trials (RCTs), clinical studies, which assess the effect of Echinacea on respiratory tract pathogens in humans. Abstracts and unpublished studies were not included. When articles contained potentially relevant data not fully reported, the authors were contacted by email for further information.

Outcomes measures

Data extraction was undertaken using a pre-defined form retrieving the following information: primary author's name, publication date, country, study design, sample size, researched plant species and preparation, duration of treatment (prevention vs acute treatment), dosage,

incidence of coronavirus virus infections and virus concentration (Ct-values), information regarding symptomatic development (e.g. total symptom score, episode duration, area-under-curve or similar). The methodological quality of included studies was assessed using the criteria as proposed by Jadad [2].

Search Strategy

We used PubMed and EMBASE databases for the literature search using a combination of keywords, which includes Medical Subject Headings (MeSH)/*Emtree* terms (Embase Subject Headings). The search strategy was limited to English, humans and included all synonyms of the following MeSH terms: Echinacea species OR inclusion coronavirus virus infections, AND Roter Sonnenhut or Purple Coneflower OR Echinacea purpurea OR human Clinical Studies OR Respiratory Tract Infections AND terms related to study design (RCTs). The following search headings/ MeSH terms were used:

(Randomized Controlled Trials as Topic / OR randomized controlled trial/ OR Random Allocation/ OR Double Blind Method/ OR Single Blind Method/ OR clinical trial/ OR clinical trial, phase OR clinical trial, phase ii.pt. OR clinical trial, phase iii.pt. OR clinical trial, clinical studies OR phase iv.pt. OR controlled clinical trial.pt. OR randomized controlled trial.pt. OR multicenter study OR Placebo OR randomly allocated.)

AND ("Echinacea species" (MeSH Terms) OR "Echinacea species" [All Fields]) OR ("Purple Coneflower" (MeSH Terms) OR "Purple Coneflower" [All Fields]) OR ("Echinacea purpurea " (MeSH Terms) OR "Echinacea purpurea " [All Fields]) OR ("Echinacea [All Fields] AND "purpurea [All Fields]) OR ("Echinacea species, Roter sonnenhut " (All Fields) OR ("Echinacea species"(All Fields) AND "Roter"(All Fields) AND "sonnenhut"(All Fields))

AND ("clinical study"[Publication Type] OR "clinical studies as topic"[MeSH Terms] OR "clinical studies"[All Fields]) AND ("respiratory tract infections"[MeSH Terms] OR ("respiratory"[All Fields] AND "tract"[All Fields] AND "infections"[All Fields]) OR "respiratory tract infections"[All Fields]) AND ("human s"[All Fields] OR "humans"[MeSH Terms] OR "humans"[All Fields] OR "human"[All Fields]) ("respiratory system"[MeSH Terms] OR ("respiratory"[All Fields] AND "system"[All Fields]) OR "respiratory system"[All Fields] OR ("respiratory"[All Fields] AND "tract"[All Fields]) OR "respiratory tract"[All Fields]) AND ("virology"[MeSH Subheading] OR "virology"[All Fields] OR "viruses"[All Fields] OR "viruses"[MeSH Terms] OR "virus s"[All Fields] OR "viruse"[All Fields] OR

"virus"[All Fields]) AND ("body fluids"[MeSH Terms] OR ("body"[All Fields] AND "fluids"[All Fields]) OR "body fluids"[All Fields])

AND "Respiratory Tract Infections" (MeSH Terms) OR ("Respiratory" [All Fields] AND "Tract [All Fields] AND "Infections" [All Fields]) OR "Respiratory Tract Infections" {All Fields] OR ("Respiratory" [All Fields] AND "Tract" [All Fields] AND "Infections" [All Fields]) OR "Respiratory Tract Infections" [All Fields]) "safety and efficacy " (MeSH Terms) OR ("safety" [All Fields] AND "efficacy" [MeSH Terms] AND "common cold" (MeSH Terms) OR ("common" [All Fields] AND "cold" [MeSH Terms] OR "disease"[All Fields] OR "diseases"[All Fields] OR "disease s"[All Fields] OR "diseased"[All Fields]) "corona virus" (MeSH Terms) OR ("corona" [All Fields] AND "Virus" [All Fields]) [2] ['SARS-CoV2)OR 'SARS' OR 'CoV2'] AND [children OR paediatric] AND [adults].

Data Extraction

After applying the eligibility criteria, articles that were relevant for full-text screening were chosen. Two authors worked independently on article screening and data extraction. If there were any disagreements, they were settled by discussion or consensus with a third independent reviewer. The articles were initially screened on the basis of their title, followed by the abstract of the article. The title and abstract of the articles were irrelevant to the present investigation; these were excluded from the secondary screening. The selected articles from the initial screening were assessed for full-text screening to find out the eligibility criteria of the current review.

Results

A total of 1687 articles were identified through database searching including PubMed and EMBASE, of which 988 articles were excluded at the initial screening due to duplicated and irrelevant articles. 60 potentially relevant articles were selected for the full text assessment, of which 58 were further excluded due to studies that were not reported respiratory tract infections, coronavirus, Echinacea species, non-RCT and human studies (n= 57) and combination of Zingiber officinale and Echinacea (n= 1), which was detailed in PRISMA flow chart (Figure 1). Finally, 2 articles were selected for the narrative review, which met the eligibility criteria of the current study.

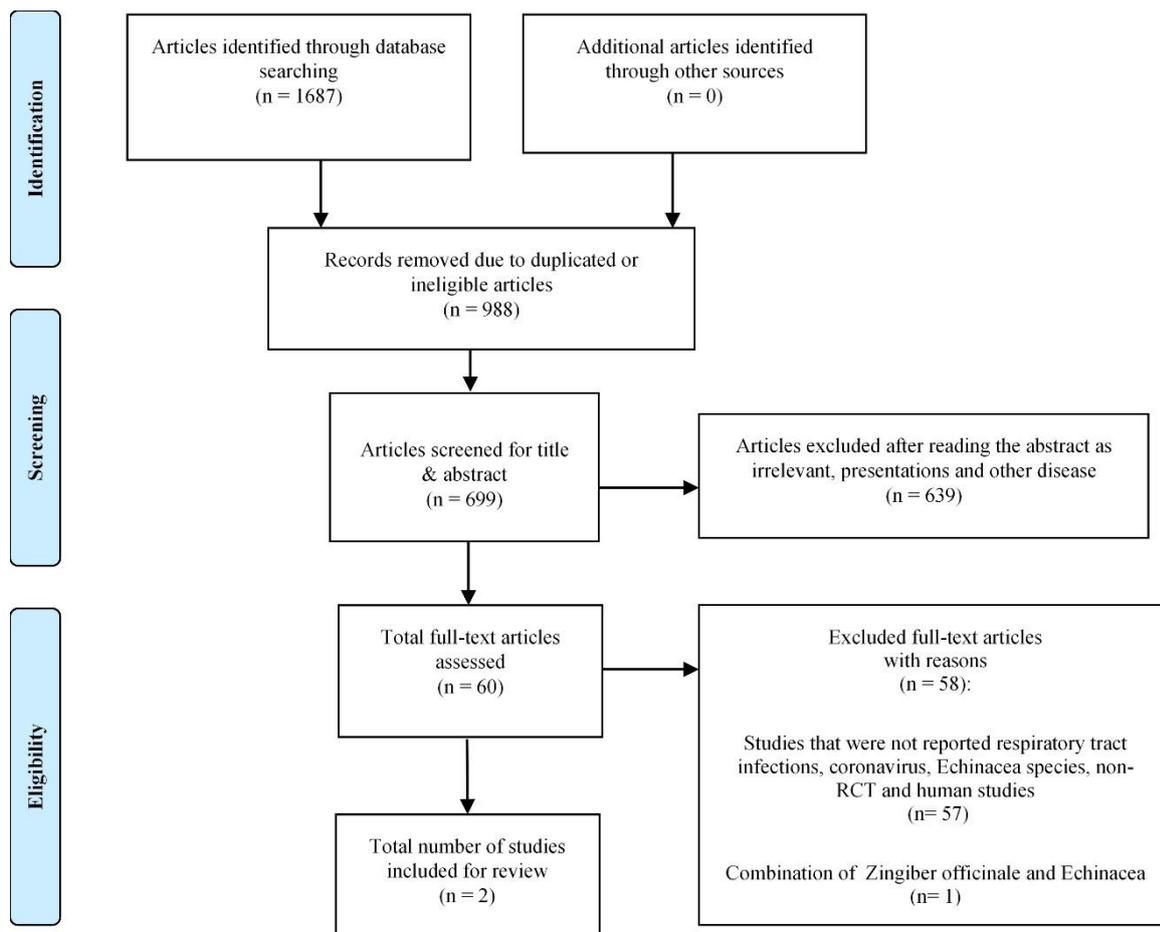

Figure S1: PRISMA flow chart for systematic reviews detailing the database searches, the number of publications screened and eligible results retrieved.

58	Esin Akyüz et al	2019	Protein-Protected Gold Nanocluster-Based Biosensor for Determining the Prooxidant Activity of Natural Antioxidant Compounds	Excluded because NO evidence of Corona virus infection	https://pubmed.ncbi.nlm.nih.gov/31459484/
59	Alfredo Guarino et al	2013	Definitions and outcomes of nutritional interventions in children with respiratory infections: the approach of the COMMENT initiative	Excluded because NO evidence of Corona virus infection	https://pubmed.ncbi.nlm.nih.gov/24296796/
60	Song Mao et al	2013	Vitamin D supplementation and risk of respiratory tract infections: a meta-analysis of randomized controlled trials	Excluded because NO evidence of Corona virus infection	https://pubmed.ncbi.nlm.nih.gov/23815596/

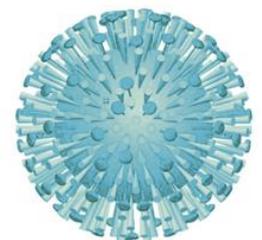

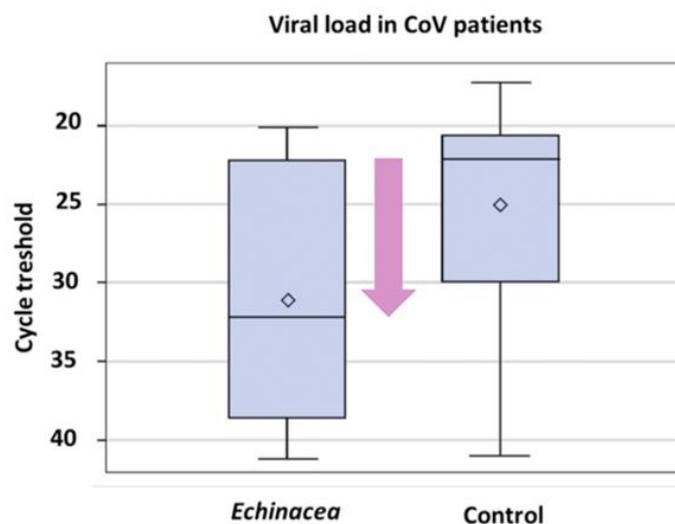

A6. Data Extraction Template

Source details	Study code
	Author
	Year
	Title
Methodology	Study design
	Cohort
Participant characteristics	Sample size
	Ethnicity
	Age
	Gender
	Respiratory tract infection
	Timing of data collection
	Methodology (assessment of) for Respiratory tract pathogens (coronavirus)
	Treatment
	Screening
Outcome (Prevalence & Epidemiology)	Total symptom score
	Episode duration
	Area-under-curve or similar

Graphical abstract

Echinacea purpurea (L.) Moench

Coronavirus

$$\Delta = -1.81 \log (98.5 \%), p = 0.048$$
