

**Supplemental Data: Salinity Impacts the functional *mcrA* and *dsrA* gene abundances in Everglades marshes**

**Supplemental Table S1:** *mcrA* gene samples from brackish (BW) and freshwater (FW) sites with corresponding year of collection: initial (Y0) or 2 years later (Y2). Samples with no salt treatment (Control) or treated with saltwater pulses (Salt) are indicated in the treatment column. The Chambers indicated as controls were sampled at Y0 and again at Y2 while the treatment chambers were sampled only at Y2. Total Observed OTUs (Operational Taxonomic Units) indicate the total number of reads identified as a taxonomic cluster. Observed Unique OTUs indicate the richness within the sample as explained by the various diversity indices, Chao1, Shannon, Simpson, and Inverse Simpson.

Group	Treatment	Chamber	Total Observed OTUs	Unique Observed OTUs	Chao1	Shannon	Simpson	Inverse Simpson

**Supplemental Figure S1:** Differentially abundant genera found at the Brackish site. Differential abundance plots between year 2 samples - control and saltwater treatment. Negative log fold changes represent significant differential abundance at the control samples. Decreases in abundance were observed in the Methanobacteriales Order after treatment.

**Supplemental Figure S2:** Differentially abundant genera found at the Freshwater site. Differential abundance plots between year 2 samples - control and saltwater treatment. Negative log fold changes represent significant differential abundance at the control samples. Decreases in abundance were observed in the Methanobacteriales Order after treatment.
